Conventions

1. GUI Symbols

Interface symbol	Description	Example
Boldface	1. Button names 2. Window names, tab name, field name and menu items 3. Link	1. Click OK . 2. Select Config Wizard . 3. Click the Download File link.
>	Multi-level menus items	Select System > Time .

2. Signs

This document also uses signs to indicate some important points during the operation. The meanings of these signs are as follows:

Warning

An alert that calls attention to important rules and information that if not understood or followed can result in data loss or equipment damage.

Note

An alert that calls attention to essential information that if not understood or followed can result in function failure or performance degradation.

 Instruction

An alert that contains additional or supplementary information that if not understood or followed will not lead to serious consequences.

 Specification

An alert that contains a description of product or version support.

3. Instruction

This manual is used to guide users to understand the product, install the product, and complete the configuration.

- The example of the port type may be different from the actual situation. Please proceed with configuration according to the port type supported by the product.
- The example of display information may contain the content of other product series (such as model and description). Please refer to the actual display information.
- The routers and router product icons involved in this manual represent common routers and layer-3 switches running routing protocols.

Overview

This cookbook consists of multiple independent volumes, introducing the installation, deployment, and web-based configuration of the RG-RAP72 access point, including:

- 01- Installation Guide
- 02- ReyeeOS 2.284 Configuration Guide

Conventions

The signs used in this document are described as follows:

1. Signs

Danger

An alert that contains important safety instructions. Before you work on any equipment, be aware of the hazards involved and be familiar with standard practices in case of accidents.

Warning

An alert that calls attention to important rules and information that if not understood or followed can result in data loss or equipment damage.

Caution

An alert that calls attention to essential information that if not understood or followed can result in function failure or performance degradation.

Note

An alert that contains additional or supplementary information that if not understood or followed will not lead to serious consequences.

Specification

An alert that contains a description of product or version support.

2. Notes

This manual presents installation instructions, troubleshooting techniques, technical specifications, cable and connector requirements, and usage guidelines. It is intended for users who want to gain insight into the above content and have some experience in installing and maintaining network hardware. It is assumed that users are already familiar with relevant terms and concepts.

1 Overview

1.1 About the RG-RAP72

The RG-RAP72 is a Wi-Fi 7 dual-band, ceiling-mounted wireless access point (AP) launched by Ruijie Reyee, designed for indoor environments such as offices, hotels, and schools. It supports IEEE 802.3af/at-compliant Power over Ethernet (PoE) and a 12 V/1.5 A local power supply, allowing you to choose the most suitable power supply mode based on your needs. In compliance with IEEE 802.11a/b/g/n/ac/ax/be standards, the RG-RAP72 operates on both the 2.4 GHz and 5 GHz frequency bands. It delivers ultra-fast speeds of up to 3570 Mbps, with 688 Mbps on the 2.4 GHz band and 2882 Mbps on the 5 GHz band, fulfilling requirements for high-speed wireless connectivity. This AP provides one 2.5 Gbps Ethernet port to fully utilize high-speed wireless performance. With Reyee's self-organizing networking (SON) technology, the RG-RAP72 ensures comprehensive indoor Wi-Fi coverage and meets diverse networking requirements for various services.

1.2 Package Contents

Table 1-1 Package Contents

No.	Item	Quantity
1	RG-RAP72 access point	1
2	Mounting bracket	1
3	Phillips pan head screws (M4 x 20 mm)	4
4	Wall anchors	4
5	User Manual	1
6	Key to Kensington lock	1
7	Mounting template	1
8	Warranty Card	1

 Note

The package contents are subject to the purchase contract, and actual delivery may vary. Please check the items carefully against the package contents or purchase contract. If you have any questions, please contact the distributor.

1.3 Product Appearance

Figure 1-1 Appearance of the RG-RAP72

1.3.2 Front Panel

Figure 1-2 Front Panel of the RG-RAP72

Table 1-2 LEDs

No.	Item	Status	Description
1	System status LED	Solid blue	The AP is operating normally without any alarms.
		Off	The AP is not receiving power.
		Fast blinking blue (8 Hz)	The AP is starting up.
		Slow blinking blue (0.5 Hz)	The AP is not connected to the Internet.
		Two blue flashes	Possible cases are as follows: ● The AP is being reset. ● The AP is being upgraded. ● The AP is recovering. Caution Do not power off the AP when its LED is in this state.
		Blinking blue (three quick flashes followed by one slow flash)	Other faults have occurred.

1.3.3 Rear Panel

Figure 1-3 Rear Panel of the RG-RAP72

Table 1-3 Components on the Rear Panel

No.	Component	Description
1	Reset button	Press and hold it for less than 2s to restart the AP.
		Press and hold it for more than 5s to restore the AP to factory settings.
2	DC=12V connector	Connects to a DC power adapter for power supply. The DC power voltage is 12 V and the current is 1.5 A.
3	LAN/2.5G/PoE port	1 x 10/100/1000/2500BASE-T Ethernet port that supports PoE input.
4	Nameplate	The nameplate is located at the bottom of the device.

1.4 Technical Specifications

Table 1-4 Technical Specifications

Radio Design	2.4 GHz dual-stream 5 GHz dual-stream
Transmission Standards	IEEE 802.11be, IEEE 802.11ax, IEEE 802.11ac Wave 2/Wave 1, IEEE 802.11a/b/g/n
Operating Frequency Bands	IEEE 802.11b/g/n/ax/be: 2.4 GHz to 2.4835 GHz IEEE 802.11a/n/ac/ax/be: 5.150 GHz to 5.350 GHz, 5.470 GHz to 5.725 GHz, 5.725 GHz to 5.850 GHz  Note Country-specific restrictions apply.
Antenna Type	Built-in omni-directional antenna (2.4 GHz: 3.23 dBi; 5 GHz: 4.44 dBi)
Number of Spatial Streams	2.4 GHz: 2x2 MU-MIMO 5 GHz: 2x2 MU-MIMO
Data Rate	2.4 GHz: 688 Mbps 5 GHz: 2882 Mbps Combined: 3570 Mbps
Modulation	OFDM: BPSK @ 6/9 Mbps, QPSK @ 12/18 Mbps, 16-QAM @ 24 Mbps, and 64-QAM @ 48/54 Mbps DSSS: DBPSK @ 1 Mbps, DQPSK @ 2 Mbps, and CCK @ 5.5/11 Mbps MIMO-OFDM: BPSK, QPSK, 16-QAM, 64-QAM, 256-QAM, 1024-QAM, and 4096-QAM OFDMA

Receiver Sensitivity	11b: -91 dBm (1 Mbps), -88 dBm (5.5 Mbps), -85 dBm (11 Mbps) 11a/g: -89 dBm (6 Mbps), -80 dBm (24 Mbps), -76 dBm (36 Mbps), -71 dBm (54 Mbps) 11n: -83 dBm (MCS0), -65 dBm (MCS7), -83 dBm (MCS8), -65 dBm (MCS15) 11ac: 20 MHz: -83 dBm (MCS0), -57 dBm (MCS9) 11ac: 40 MHz: -79 dBm (MCS0), -57 dBm (MCS9) 11ac: 80 MHz: -76 dBm (MCS0), -51 dBm (MCS9) 11ac: 160 MHz: -76 dBm (MCS0), -50 dBm (MCS9) 11ax: 20 MHz: -85 dBm (MCS0), -58 dBm (MCS11) 11ax: 40 MHz: -82 dBm (MCS0), -54 dBm (MCS11) 11ax: 80 MHz: -79 dBm (MCS0), -52 dBm (MCS11) 11ax: 160 MHz: -76 dBm (MCS0), -49 dBm (MCS11) 11be: 20 MHz: -85 dBm (MCS0), -52 dBm (MCS13) 11be: 40 MHz: -82 dBm (MCS0), -49 dBm (MCS13) 11be: 80 MHz: -82 dBm (MCS0), -46 dBm (MCS13) 11be: 160 MHz: -79 dBm (MCS0), -44 dBm (MCS13)
Max. Transmit Power	Frequency bands and maximum Effective Isotropic Radiated Power (EIRP):  Note The actual transmit power may vary in different countries and regions according to the rules and regulations. ● European Union & United Kingdom: ○ 2400–2483.5 MHz, EIRP ≤ 20 dBm ○ 5150–5350 MHz, EIRP ≤ 23 dBm ○ 5470–5725 MHz, EIRP ≤ 30 dBm ● Myanmar: ○ 2400–2483.5 MHz, EIRP ≤ 23 dBm ○ 5725–5825 MHz, EIRP ≤ 30 dBm ● Thailand: ○ 2400–2483.5 MHz, EIRP ≤ 20 dBm ○ 5150–5350 MHz, EIRP ≤ 23 dBm ○ 5470–5725 MHz, EIRP ≤ 30 dBm ○ 5725–5825 MHz, EIRP ≤ 30 dBm ● Indonesia: ○ 2400–2483.5 MHz, EIRP ≤ 27 dBm ○ 5150–5350 MHz, EIRP ≤ 23 dBm ○ 5725–5825 MHz, EIRP ≤ 23 dBm ● Egypt: ○ 2400–2483.5 MHz, EIRP ≤ 20 dBm ○ 5150–5350 MHz, EIRP ≤ 23 dBm
Power Step	1 dBm

Dimensions (Diameter x Height)	Ø195 mm x 41 mm (7.68 in. x 1.61 in.) (excluding the mounting bracket)
Weight	Main unit: ≤ 0.6 kg (1.32 lbs)
Service Ports	1 x 10/100/1000/2500BASE-T Ethernet port, supporting PoE input
Status LED	1 x system status LED (blue)
Power Supply	● DC power supply using a power adapter (input voltage and current: 12 V/1.5 A) ● PoE: Compliance with the IEEE 802.3af/at (PoE/PoE+) standard
Power Consumption	≤ 14 W
Environmental	Operating temperature: 0°C to 40°C (32°F to 104°F)
	Storage temperature: -40°C to +70°C (-40°F to +158°F)
	Operating humidity: 5% RH to 95% RH (non-condensing)
	Storage humidity: 5% RH to 95% RH (non-condensing)
Mounting	Ceiling-mount, wall-mount, or mount in an 86 mm junction box
Certification	CE, RoHS, ISED, and cTUVus
Mean Time Between Failures (MTBF)	> 400,000 hours

Warning

In a domestic environment, this product may cause radio interference, in which case the user may be required to take adequate measures.

1.5 Power Supply

The RG-RAP72 supports DC and PoE power supply.

- When the AP is powered by a DC power adapter, the power adapter should have a voltage of 12 V and a current of 1.5 A. If you require a DC power adapter, it can be purchased separately from Ruijie. Dimensions of the DC power connector (outer diameter x inner diameter x depth): 5.5 mm x 2.1 mm x 10 mm (0.22 in. x 0.08 in. x 0.39 in.).
- When the AP is powered by standard PoE, connect one end of the Ethernet cable to the LAN/2.5G/PoE port on the AP, and the other end to a PoE-capable switch or any other PoE power source equipment (PSE). For optimal performance, you are advised to use an IEEE 802.3af/at-compliant PoE power source.

Caution

- The DC input power of the DC power adapter must be greater than the actual power consumption of the AP.

- When the AP is powered by a DC power adapter, you are advised to use the power adapter that comes with the Ruijie device.
 - Ruijie-certified PoE adapters are recommended.
-

1.6 Cooling

The RG-RAP72 adopts a fanless design with natural cooling.

 Caution

Ensure that there is sufficient space around the AP for heat dissipation.

2 Preparing for Installation

2.1 Safety Guidelines

Note

- To avoid personal injury or equipment damage, review the safety guidelines in this chapter before you begin the installation.
 - The following safety guidelines may not include all the potentially hazardous situations.
-

2.1.1 General Safety Guidelines

- Do not expose the equipment to high temperature, dusts, or harmful gases. Do not install the equipment in an inflammable or explosive environment. Keep the equipment away from EMI sources such as large radar stations, radio stations, and substations. Do not subject the equipment to unstable voltage, vibration, and noises.
 - The installation site should be dry. Do not install the equipment in a place near the sea. Keep the equipment at least 500 meters away from the ocean and do not face it towards the sea breeze.
 - The installation site should be free from water flooding, seepage, dripping, or condensation. The installation site should be selected according to network planning, communications equipment features, and considerations such as climate, hydrology, geology, earthquake, electrical power, and transportation.
-

Caution

Always install and remove the equipment according to the installation procedures outlined in this document.

2.1.2 Chassis-Lifting Guidelines

- After the equipment is installed, avoid handling it frequently.
- Cut off all power supplies and unplug all power cords before moving or handling the equipment.

2.1.3 Electrical Safety Guidelines

Warning

- Improper or incorrect electric operations may cause a fire, electric shock, and other accidents, and lead to severe and fatal personal injury and device damage.
 - Direct or indirect contact with high voltage or mains power supply through wet objects may cause fatal dangers.
-
- Observe local regulations and specifications during electric operations. Only personnel with relevant qualifications can perform such operations.
 - Check whether there are potential risks in the work area. For example, check whether the ground is wet.
 - Find out the position of the indoor emergency power switch before installation. Cut off the power switch in case of accidents.

- Make sure that the equipment is powered off when you cut off the power supply.
- Do not place the equipment in a damp/wet location. Do not let any liquid enter the chassis.
- Keep the equipment far away from grounding or lightning protection devices for power equipment.
- Keep the equipment away from radio stations, radar stations, high-frequency high-current devices, and microwave ovens.

2.2 Site Requirements

Install the equipment indoors to ensure its normal operation and prolonged service life. The installation site must meet the following requirements.

2.2.1 Bearing Requirements

Ensure that the installation position is sturdy enough to support the weight of the equipment and its accessories.

2.2.2 Space Requirements

- The equipment should be installed in an open environment if possible. If the environment is enclosed, confirm that a good ventilation and heat dissipation system is available.
- Ensure that the installation location is suitable for the RG-RAP72, leaving sufficient space on the front, back, left, and right sides for heat dissipation.

2.2.3 Ventilation Requirements

The RG-RAP72 dissipates heat naturally. Therefore, certain space needs to be reserved around the equipment for heat dissipation.

2.2.4 Temperature/Humidity Requirements

To ensure that the RG-RAP72 works properly and has a long service life, maintain a proper temperature and humidity in the operating environment. The operating environment with too high or too low temperature and humidity for a long period of time may damage the equipment.

- In an environment with high relative humidity, the insulating material may have poor insulation or even leak electricity. Sometimes high humidity may causes changes in the mechanical properties and causes rusting of metal parts.
- In an environment with low relative humidity, static electricity is prone to occur and damage the internal circuits of the equipment.
- Too high temperatures can accelerate the aging of insulation materials, greatly reducing the reliability of the equipment and severely affecting its service life.

The following table lists the temperature and humidity requirements.

Table 2-1 Temperature/Humidity Requirements

Operating Temperature	Operating Humidity
0°C to 40°C (32°F to 104°F)	5% RH to 95% RH (non-condensing)

2.2.5 Cleanliness Requirements

Dust poses a major threat to the equipment. The indoor dust takes on a positive or negative static electric charge when falling on the switch, causing poor contact of the metallic joint. Such electrostatic adhesion may occur more easily when the relative humidity is low, not only affecting the service life of the equipment, but also causing communication faults. The following table describes the requirements for the dust content and granularity in the machine room.

Table 2-2 Requirements for Dust

Dust	Unit	Content
Dust particles (diameter $\geq 0.5 \mu\text{m}$)	Particles/ m^3	$\leq 3.5 \times 10^6$
Dust particles (diameter $\geq 5 \mu\text{m}$)	Particles/ m^3	$\leq 3.5 \times 10^4$

Apart from dust, the salt, acid, and sulfide in the air in the machine room must meet strict requirements. These harmful substances will accelerate metal corrosion and component aging. Therefore, the machine room should be properly protected against the intrusion of harmful gases, such as sulfur dioxide, hydrogen sulfide, nitrogen dioxide, and chlorine gas. The following table lists limit values for harmful gases.

Table 2-3 Requirements for Gases

Gas	Average (mg/m^3)	Maximum (mg/m^3)
Sulfur dioxide (SO_2)	0.2	1.5
Hydrogen sulfide (H_2S)	0.006	0.03
Nitrogen dioxide (NO_2)	0.04	0.15
Ammonia gas (NH_3)	0.05	0.15
Chlorine gas (Cl_2)	0.01	0.3

Note

Average refers to the average value of harmful gases measured in one week. Maximum refers to the upper limit of harmful gases measured in one week, and the maximum value cannot last for more than 30 minutes every day.

2.2.6 ESD Requirements

This equipment is engineered with stringent anti-static measures during circuit design. However, excessive static electricity can still potentially damage the printed circuit board. Static electricity in the communication network connected to the equipment primarily comes from two sources:

- Outdoor high-voltage power lines, lightning, and other external electric fields; and
- Internal systems such as flooring materials and the internal structure of the equipment.

To prevent damage from static electricity, pay attention to the following:

- Keep the indoor installation environment clean and free of dust; and
- Maintain appropriate temperature and humidity conditions.

2.2.7 EMI Requirements

- Keep the equipment far away from grounding or lightning protection devices for power equipment.
- Keep the equipment away from radio stations, radar stations, high-frequency high-current devices, and microwave ovens.

2.3 Tools

Common Tools	Phillips screwdriver, cables, fastening bolts, diagonal plier, cable ties
Special Tools	Anti-ESD gloves, wire stripper, crimper, RJ45 crimping plier, wire cutter, and waterproof tape
Meters	Multimeter and bit error rate tester (BERT)

Note

The equipment is delivered without a toolkit. Prepare the preceding tools by yourself.

3 Installing the AP

The AP is required to be fixed indoors.

⚠ Caution

Before installing the equipment, ensure that guidelines and requirements in Chapter 2 have been met.

3.1 Before You Begin

Carefully plan and arrange the installation position, networking mode, power supply, and cabling before installation. Confirm the following requirements before installation:

- The installation site provides sufficient space for proper ventilation.
- The installation site meets the temperature and humidity requirements of the AP.
- The power supply and required current are available in the installation site.
- The selected power supply modules meet the system power requirements.
- The installation site meets the cabling requirements of the AP.
- The installation site meets the site requirements of the AP.
- The customized AP meets the client-specific requirements.

3.2 Safety Precautions During Installation

To ensure the normal operation and prolonged service life of the AP, observe the following safety precautions:

- Do not power on the AP during installation.
- Place the AP in a well-ventilated environment.
- Do not subject the AP to high temperatures.
- Keep the AP away from high-voltage power cables.
- Install the AP indoors.
- Do not expose the AP in a thunderstorm or strong electric field.
- Keep the AP clean and dust-free.
- Cut off the power switch before cleaning the AP.
- Do not wipe the AP with a damp cloth.
- Do not wash the AP with liquid.
- Do not open the enclosure when the AP is working.
- Fasten the AP tightly.

3.3 Installing the AP

Note

- For indoor environments, ceiling mounting is preferred because it offers a broader coverage area than wall mounting.
- This installation guide is for reference only. The actual installation procedure may differ depending on the specific product.

3.3.1 Mounting the AP on a Ceiling or Wall

- (1) Drill holes in the ceiling or wall using the mounting template.

- (2) Secure the mounting bracket to the ceiling or wall using wall anchors and Phillips pan head screws (M4 x 20 mm).

⚠ Caution

The plane deviation of the wall in the installation area should be within 2 mm (0.08 in.), and the recommended torque for installation is 4kgf.cm. In case of an uneven installation area, mount the AP on a protruding wall using screws.

(3) Connect cables according to the actual topology. The following describes how to connect cables on the AP side.

- Ethernet cable: Connect one end of the Ethernet cable to the LAN/2.5G/PoE port (supporting PoE input) on the rear of the AP.
- DC power cord: When DC power supply is used, connect one end of the power cord to the 12 V DC power connector on the rear of the AP.

The cables can be routed either through concealed wiring or exposed wiring methods.

o Concealed wiring:

- a Route the cable through the ceiling or wall and connect it to the Ethernet port on the rear of the device.

- b Align the slots on the rear of the AP with the square feet on the mounting bracket, and slide the AP into the mounting bracket slowly to ensure that the AP is secured.

c The installation is complete.

o Exposed wiring:

a Remove the knockout from the cable inlet opening and route the cable through it.

- b Align the slots on the rear of the AP with the square feet on the mounting bracket, and slide the AP into the mounting bracket slowly to ensure that the AP is secured.

- c The installation is complete.

⚠ Caution

- Before securing the AP to the mounting bracket, connect the cables first.
 - Align the slots on the rear of the AP and slid them into the square feet on the mounting bracket. Do not press the slots into the square feet by force.
 - After the installation is complete, check whether the AP is secured.
-

3.3.2 Mounting the AP in an 86 mm Junction Box

- (1) Remove the cover of the 86 mm junction box.

- (2) Align the mounting holes of the bracket with the screw holes in the 86 mm junction box. Then, secure the bracket to the junction box using Phillips pan head screws (M4 x 20 mm).

Note

Select a mounting bracket with different hole combinations based on junction box specifications.

(3) Connect cables according to the actual topology. The following describes how to connect cables on the AP side.

- Ethernet cable: Connect one end of the Ethernet cable to the LAN/2.5G/PoE port (supporting PoE input) on the rear of the AP.
- DC power cord: When DC power supply is used, connect one end of the power cord to the 12 V DC power connector on the rear of the AP.

(4) Align the slots on the rear of the AP with the square feet on the mounting bracket, and slide the AP into the mounting bracket slowly to ensure that the AP is secured.

(5) The installation is complete.

⚠ Caution

- Before securing the AP to the mounting bracket, connect the cables first.
 - Align the slots on the rear of the AP and slid them into the square feet on the mounting bracket. Do not press the slots into the square feet by force.
 - After the installation is complete, check whether the AP is secured.
-

3.4 Removing the AP

(1) Insert the key to Kensington lock into the reserved slot.

(2) Slide down the AP as indicated by the arrow.

3.5 Connecting Cables

Connect twisted pairs with the LAN/PoE port on the AP. See [7.1 Connectors and Media](#) for supported wiring of twisted pairs.

Caution

- Avoid a small bend radius at the connector.
 - You are advised not to use Ethernet cables with protective caps for the RG-RAP72, as they complicate the assembly of the Ethernet cables.
-

3.6 Bundling Cables

Precautions

- Bundle the cable in a visually pleasing way.
- Bend twisted pairs naturally or to a large radius close to the connector.
- Do not over-tighten the twisted pair bundle as it may reduce the cable life and performance.

Bundling Steps

- (1) Bundle the hanging part of the twisted pairs using cable ties and lead them to the LAN/PoE port of the AP by convenience.
- (2) Fasten the twisted pair cables to the cable trough of the mounting bracket.
- (3) Extend the twisted pair cables under the AP and route them in a straight line.

3.7 Verifying the Installation

- Verify that the AP is securely fastened.
- Verify that the twisted pair cable matches the port type.
- Verify that the cables are properly bundled.
- Verify that the PSE is IEEE 802.3af/at-compliant.

4 Commissioning

4.1 Setting Up the Configuration Environment

After powering on the AP through a DC power adapter or a PSE, ensure that the power cord is properly connected and meets safety requirements.

4.2 Powering on the AP

4.2.1 Checklist Before Power-On

- The power cord is properly connected.
- The power voltage meets the requirement.

4.2.2 Checklist After Power-on

- Verify the LED status.
- After the AP is powered on, verify that the SSID can be searched by a mobile phone or other wireless devices.

4.3 Troubleshooting Power Supply Failures

You can determine whether there is a power system failure by checking the LED status on the front panel of the RG-RAP72. For the LED status description, see [Table 1-2 LEDs](#). Perform the following checks in the case of any abnormality:

- Verify that the AP is properly powered.
- Verify that the Ethernet port is correctly connected.

Note

If the AP cannot be powered on after all the preceding items are verified, contact your local distributor or technical support.

5 Monitoring and Maintenance

5.1 Monitoring

When the RG-RAP72 is operating, you can monitor the device running status by observing the LED. For LED status description, see [Table 1-2 LEDs](#).

5.2 Hardware Maintenance

If the hardware is faulty, contact your local distributor.

6 Common Troubleshooting

6.1 Troubleshooting Flowchart

6.2 Common Faults

6.2.1 The LED is Off After the AP is Powered On

- If you use a PoE power supply, verify that the PSE is IEEE 802.11at-compliant, and then verify that the cable is connected properly.
- If you use a power adapter, verify that the power adapter is connected with an active power outlet, and then verify that the power adapter works properly.

6.2.2 Ethernet Port Is Not Working After the Ethernet Cable Is Plugged In

Verify that the device at the other end of the Ethernet cable is working properly, and then verify that the Ethernet cable is capable of providing the required data rate and is properly connected.

6.2.3 A Client Cannot Discover the AP

- (1) Verify that the AP is properly powered.
- (2) Verify that the Ethernet port is correctly connected.

- (3) Verify that the AP is correctly configured.
- (4) Move the client closer to the AP.

7 Appendix

7.1 Connectors and Media

7.1.1 10/100/1000/2.5GBASE-T Port

A 10/100/1000/2.5GBASE-T port supports four rates with auto-negotiation, and supports the automatic MDI/MDIX crossover function at these four rates.

Compliant with IEEE 802.3bz, the 2.5GBASE-T port requires Cat5e or higher 100-ohm unshielded twisted pair (UTP) or shielded twisted pair (STP) cables with a maximum distance of 100 m (328.08 ft.).

Compliant with IEEE 802.3ab, the 1000BASE-T port requires Cat5/5e or higher 100-ohm unshielded twisted pair (UTP) or shielded twisted pair (STP) cables with a maximum distance of 100 m (328.08 ft.).

The 1000/2.5GBASE-T port requires all four pairs of wires to be connected for data transmission. The following figure shows the four pairs of wires for the 1000/2.5GBASE-T port.

Figure 7-1 1000/2.5GBASE-T Twisted Pair Connections

A 10BASE-T/100BASE-TX port can be interconnected using cables of the preceding specifications. For 10 Mbps, the 10BASE-T/100BASE-TX port can be connected using 100-ohm Category 3, Category 4, and Category 5 cables; for 100 Mbps, the 10BASE-T/100BASE-TX port can be connected using 100-ohm Category 5 cables with a maximum connection distance of 100 meters (328 ft.). [Table 7-1](#) lists 10BASE-T/100BASE-TX pin assignments.

Table 7-1 10BASE-T/100BASE-TX Pin Assignments

Pin	Socket	Plug
1	Input Receive Data+	Output Transmit Data+
2	Input Receive Data-	Output Transmit Data-
3	Output Transmit Data+	Input Receive Data+

6	Output Transmit Data-	Input Receive Data-
4, 5, 7, 8	Not Used	Not Used

[Figure 7-2](#) shows feasible connections of the straight-through and crossover twisted pairs for a 10BASE-T/100BASE-TX port.

Figure 7-2 10BASE-T/100BASE-TX Twisted Pair Connections

Straight-Through		Crossover	
Device	Device	Device	Device
1 IRD+ ←→	1 OTD+	1 IRD+ ←→	1 IRD+
2 IRD- ←→	2 OTD-	2 IRD- ←→	2 IRD-
3 OTD+ ←→	3 IRD+	3 OTD+ ←→	3 OTD+
6 OTD- ←→	6 IRD-	6 OTD- ←→	6 OTD-

7.2 Cabling Recommendations

During installation, route cable bundles upward or downward along the sides of the rack depending on the actual situation in the equipment room. All adapted connectors should be placed at the bottom of the rack in an orderly manner, and cannot be exposed outside the rack. Power cords are routed upward or downward beside the rack close to the location of the DC power distribution box, AC socket, or surge protection box in the equipment room.

7.2.1 Requirements for the Minimum Bend Radius of Ethernet Cables

- The bend radius of a fixed power cord, Ethernet cable, or flat cable should be over five times greater than their respective diameters. The bend radius of these cables that are often bent or plugged should be over seven times greater than their respective diameters.
- The bend radius of a fixed common coaxial cable should be over seven times greater than its diameter. The bend radius of these cables that are often bent or plugged should be over 10 times greater than their respective diameters.
- The minimum bend radius of a high-speed cable, such as an SFP+ cable, should be over five times greater than its diameter. The bend radius of these cables that are often bent or plugged should be over 10 times greater than their respective diameters.

7.2.2 Precautions for Cable Bundling

- Before cables are bound, mark labels and stick them to cables wherever appropriate.
- Cables should be neatly and properly bound in the cabinet without twisting or bending, as shown in [Figure 7-3](#).

Figure 7-3 Bundling Cables

- Route and bundle power, signal, ground cables separately. Mixed bundling is not allowed. When the cables are close to each other, crossover cabling is recommended. In the case of parallel cabling, maintain a minimum distance of 30 mm (1.18 in.) between power cords and signal cables.
- The cable management brackets and cabling troughs inside and outside the rack should be smooth without sharp corners.

- The metal holes traversed by cables should have a smooth and fully rounded surface or an insulated lining.
- Use cable ties to bundle up cables properly. Do not connect two or more cable ties to bundle up cables.
- After bundling up cables with cable ties, cut off the remaining part. The cut should be smooth and trim without sharp corners, as shown in [Figure 7-4](#).

Figure 7-4 Cutting off an Excess Cable Tie

- When cables need to be bent, bind them first, but do not tie cable ties within the bend. Otherwise, stress may be generated on the cables and causes the wires inside to break, as shown in [Figure 7-5](#).

Figure 7-5 Binding Cables

- Cables not to be assembled or the remaining parts of cables should be folded and placed in a proper position of the rack or cable trough. The proper position refers to a position that does not affect the device running or damage the equipment or cables.
- Do not bind power cords to the guide rails of moving parts.
- The power cords connecting moving parts such as door grounding cables should be reserved with some excess after being assembled. This can avoid tension or stress on power cords. After the moving part arrives

at the position of the power cords, the remaining cable part should not touch heat sources, sharp corners, or sharp edges. If heat sources cannot be avoided, high-temperature cables should be used.

- When using screw threads to secure a cable lug, ensure that the bolt or screw is properly tightened and take measures to prevent it from loosening, as shown in [Figure 7-6](#).

Figure 7-6 Fastening Cable Lugs

1. Flat washer
2. Nut

3. Spring washer
4. Flat washer

- Hard power cords should be fastened in the terminal connection area to prevent stress on terminal connection and cable.
- Do not use self-tapping screws to fasten terminals.
- Power cords of the same type and in the same cabling direction should be bundled up into cable bunches, with cables in cable bunches clean and straight.
- Bundle up cables by using cable ties.

Cable Bunch Diameter	Distance between Every Binding Point
10 mm (0.39 in.)	80 mm to 150 mm (3.15 in. to 5.91 in.)
10 mm to 30 mm (0.39 in. to 1.18 in.)	150 mm to 200 mm (5.91 in. to 7.87 in.)
30 mm (1.18 in.)	200 mm to 300 mm (7.87 in. to 11.81 in.)

- No knot is allowed in cabling or bundling.
- For wiring terminal blocks (such as air switches) of the cord end terminal type, the metal part of the cord end terminal should not be exposed outside the terminal block when assembled.

2. Signs

The signs used in this document are described as follows:

Warning

An alert that calls attention to important rules and information that if not understood or followed can result in data loss or equipment damage.

Caution

An alert that calls attention to essential information that if not understood or followed can result in function failure or performance degradation.

Note

An alert that contains additional or supplementary information that if not understood or followed will not lead to serious consequences.

 Specification

An alert that contains a description of product or version support.

3. Note

This manual introduces the product model, port type and CLI for your reference. In case of any discrepancy or inconsistency between the manual and the actual version, the actual version prevails.

1 Change Description

This section outlines the key changes in software, hardware, and documentation across versions. For detailed hardware changes between different versions, please refer to the release notes provided with the software release.

1.1 ReyeeOS 2.284

1.1.1 Hardware Changes

This is the baseline version, with no hardware changes. The following table lists the supported hardware models.

Type	Model	Version Number
Wi-Fi 7	RG-RAP72	1.xx

1.1.2 Software Feature Changes

This is the baseline version, with no changes to software features.

2 Fast Internet Access

2.1 Configuration Environment Requirements

2.1.1 PC

- Browser: Google Chrome, Internet Explorer 9.0, 10.0, and 11.0, and some Chromium/Internet Explorer kernel-based browsers (such as 360 Extreme Explorer) are supported. Exceptions such as garble or format error may occur if an unsupported browser is used.
- Resolution: 1024 x 768 or a higher resolution is recommended. If other resolutions are used, the page fonts and formats may not be aligned, the GUI is less artistic, or other exceptions may occur.

2.2 Default Configuration

Table 2-1 Default Web Configuration

Item	Default
IP address	10.44.77.254
Username/Password	A username is not required when you log in for the first time. The default password is admin .

2.3 Login to Web Interface

2.3.1 Connecting to the Access Point

You can open the management page and complete Internet access configuration only after connecting a client to the access point in either of the following ways:

- Wired Connection

Connect a local area network (LAN) port of the access point to the network port of the PC, and set the IP address of the PC. See [Configuring the IP Address of the Management Client](#).

- Wireless Connection

On a mobile phone or laptop, search for wireless network @Ruijie-SXXXX (XXXX is the last four digits of the MAC address of each device). In this mode, you do not need to set the IP address of the management Client, and you can skip the operation in [Configuring the IP Address of the Management Client](#).

2.3.2 Configuring the IP Address of the Management Client

Configure an IP address for the management client in the same network segment as the default IP address of the device (The default device IP address is 10.44.77.254, and the subnet mask is 255.255.255.0.) so that the

management client can access the device. For example, set the IP address of the management client to 10.44.77.100.

 Caution

- Make sure that the client can access the web interface as long as it can ping the access point.
 - The IP address of the management client cannot be set to 10.44.77.253, because this IP address is reserved by the device. If the management client uses this IP address, it cannot access the device.
-

2.3.3 Logging in to the Web Page

- (1) Enter the IP address (10.44.77.254 by default) of the access point in the address bar of the browser to open the login page.

 Note

If the static IP address of the device is changed, or the device obtains a new dynamic IP address, the new IP address can be used to access the web management system of the device as long as the management client and the device are in the same network segment of a LAN.

- (2) On the web page, enter the password and click **Log In** to enter the web management system.

You can use the default password **admin** to log in to the device for the first time. For security purposes, you are advised to change the default password as soon as possible after logging in, and to regularly update your password thereafter.

If you forget the IP address or password, hold down the **Reset** button on the device panel for more than 5 seconds when the device is connected to the power supply to restore factory settings. After restoration, you can use the default IP address and password to log in.

⚠ Caution

Restoring factory settings will delete the existing configuration and you are required to configure the device again at your next login. Therefore, exercise caution when performing this operation.

2.4 Work Mode

The device can work in the router mode, AP mode or wireless repeater mode. The displayed system menu page and function ranges vary with the work mode. The RAP works in the AP mode by default.

When setting the work mode, you can also set whether to enable the self-organizing network discovery function. This function is enabled by default.

Self-organizing network mode: After the self-organizing network discovery function is enabled, the new device and other unconnected devices can be discovered. Devices connect with each other to form a network based on their status and synchronize their configurations globally. You can log in to the web interface of the device to view management information of all devices on the network. After the self-organizing network discovery function is enabled, you can efficiently maintain and manage the network. You are advised to keep this function enabled.

When the device connect with each other to form a network, two configuration modes are displayed: network-wide mode and local device mode. See [2.8 Introduction to the Web I](#) .

Local device mode: After the self-organizing network discovery function is disabled, the device will not be discovered. After logging in to the web interface, you can configure and manage only the new device. If only one device is configured or global configuration does not need to be synchronized to the device, you can disable the self-organizing network discovery function.

To switch the work mode, see [5.1 Switching Work Mode](#).

2.4.1 AP Mode

The device performs L2 forwarding and does not support the DHCP address pool function. In AP mode, the device often networks with devices supporting the routing function. IP addresses of downlink wireless clients are assigned and managed by the uplink device (supporting the DHCP address pool) of the AP in a unified manner, and the AP only transparently transmits data.

2.4.2 Router Mode

The device supports N/AT routing and forwarding. The addresses of wireless clients can be assigned by the AP and wireless network data is routed and forwarded by the AP. N/AT is supported in this mode. When an AP works in the router mode, it supports device networking, network-wide configuration, and AP-specific radio functions.

There are three Internet types available: PPPoE, DHCP mode and static IP address mode. You can connect the device to an Ethernet cable or an upstream device.

⚠ Caution

After switching to the router mode, the device's LAN IP address will change to 192.168.120.1. Please obtain an IP address automatically for your management client and enter 10.44.77.254 into the address bar of the browser to log in to web interface again.

2.4.3 Wireless Repeater Mode

The device does not support the routing and DHCP server functions in the wireless repeater mode. IP addresses of the clients are assigned and managed by the primary router. On an available network, the device can be connected to the primary router through wireless connection to expand the Wi-Fi coverage and increase the number of LAN ports and wireless access devices.

2.5 Configuration Wizard (Router Mode)

Upon first login, you can perform quick setup to configure the Internet type, Wi-Fi network and management password.

2.5.1 Getting Started

- (1) Connect the device to a power supply and connect the port of the device to an upstream device with an Ethernet cable. Or you can connect an Ethernet cable to the device.
- (2) Configure the Internet connection type according to requirements of the local Internet Service Provider (ISP). Otherwise, the Internet access may fail due to improper configuration. You are advised to contact your local ISP to confirm the Internet connection type:
 - o Figure out whether the Internet connection type is PPPoE, DHCP mode, or static IP address mode.
 - o In the PPPoE mode, a username, a password, and possibly a service name are needed.
 - o In the static IP address mode, an IP address, a subnet mask, a gateway, and a DNS server need to be configured.
- (3) The device works in the AP mode by default. If you want to switch the work mode to the router mode, perform the configuration on the work mode setting page. See [5.1 Switching Work Mode](#) for more details.

The screenshot displays the device's configuration page in AP mode. At the top, there's a status bar with a Wi-Fi icon, 'AP' mode indicator, and a 'Reboot' button. Below this, various system information is shown: MGMT IP (192.168.1.4), SN (G1379), MAC Address (80:C0:45), and Hardware Version (1.00). The 'Working Mode' is set to 'AP'. Navigation buttons for 'Monitor' and 'Config' are present. The main section shows a 'Normal' status with an LED indicator and 'LED blinking' location. Below this are three expandable panels: 'Clients' (showing 0/110 capacity), 'SSID' (showing a default SSID with 2.4G and 5G bands), and 'Band' (showing 2.4G and 5G channel settings). At the bottom, a table header is visible with columns: Username, SSID and Band, Signal Quality, IP/MAC, Negotiation Rate, and Online Duration. The table currently shows 'No Data'. A pagination bar at the bottom right indicates 'Total 0' and '10/page'.

2.5.2 Configuration Steps

1. Add a Device to Network

You can manage and configure all devices in the network in batches by default. Please verify the device count and network status before configuration.

Note

New devices will join in a network automatically after being powered on. You only need to verify the device count.

If a new device is detected not in the network, click **Add to My Network** and enter its management password to add the device manually.

Ruijie | Reycc
Discover Device
English

Total Devices: 25. Other Devices (to be added manually): 22.
Please make sure that the device count and topology are correct. The unmanaged switch will not appear in the list. [View Topology](#)

Start Setup

2. Creating a Network Project

(1) Click **Start Setup** to configure the Internet connection type and Wi-Fi network.

Note

Parameters displayed on the **Network Settings** page vary according to device types on the network. The following parameters are displayed when the network contains gateways, switches, and APs.

- **Internet:** Configure the Internet connection type according to requirements of the local Internet Service Provider (ISP).
 - DHCP: The access point detects whether it can obtain an IP address via DHCP by default. If the access point connects to the Internet successfully, you can click Next without entering an account.
 - PPPoE: Click PPPoE, and enter the username, password, and service name. Click Next.
 - Static IP: Enter the IP address, subnet mask, gateway, and DNS server, and click Next.
- **Wi-Fi Settings:** Select the Wi-Fi configuration mode. This configuration option is unavailable for a new project.
 - Use Old Settings: Use the Wi-Fi settings of an existing project.
 - Use New Settings: Configure the Wi-Fi network using new settings.
- **SSID and Wi-Fi Password:** The device has no Wi-Fi password by default, indicating that the Wi-Fi network is an open network. You are advised to configure a complex password to enhance the network security.
- **Country/Region:** The Wi-Fi channel may vary from country to country. To ensure that a client searches for a Wi-Fi network successfully, you are advised to select the actual country or region.
- **Time Zone:** Set the system time. The network time server is enabled by default to provide the time service. You are advised to select the actual time zone.

The screenshot displays the 'Network Settings' interface of the Ruijie iReycc system. The 'Internet' section has 'DHCP' selected. The 'Dual-Band Single' option is also selected. Under 'SSID', the frequency is '2.4G+5G' and the SSID name is 'Ruijie-m5143'. The 'Encryption' is set to 'Open' and the 'Security' is 'OPEN(Open)'. A warning message indicates no available frequency band and suggests logging in to Ruijie Cloud. At the bottom, 'Country/Region' is set to 'China (CN)' and 'Time Zone' is 'GMT+8:00 Asia/Shanghai'. 'Previous' and 'Next' buttons are at the bottom.

(2) Click **Next**. On the page that is displayed, set the project name and management password.

- **Project Name:** Identify the network project where the device is located.
- **Management Password:** The password is used for logging in to the management page.

Click **Finish**. The device will deliver the initialization and check the network connectivity.

After completing the quick setup, the new device can access the Internet. You can click **Homepage** in the upper right corner of the page to access the web interface, or bind the device with a Ruijie Cloud account for remote management. Follow the instruction to log in to Ruijie Cloud for further configuration.

Note

- If your device is not connected to the Internet, click **Service is unavailable.** in the displayed **Internet connection failed.** dialog box to exit the configuration wizard.
- Please log in again with the new password if you change the management password.

2.6 Configuration Wizard (AP Mode)

2.6.1 Getting Started

- Power on the device and connect the device to an upstream device.
- Make sure that the device can access the Internet.

2.6.2 Configuration Steps

The device obtains the IP address through the DHCP by default. Configure the SSID, Wi-Fi password and management password. The default Internet connection type is DHCP mode. You are advised to use the default value.

The screenshot shows the 'Network Settings' page in the Ruijie RCycc web interface. At the top, there's a blue header with the 'Ruijie | RCycc' logo and 'Network Settings' text. On the right, there's a language dropdown set to 'English'. The main content area has a white background. At the top of this area, there are two radio buttons for 'Internet': 'DHCP' (selected) and 'Static IP'. Below this is a 'Dual-Band Single' toggle switch, which is turned on. Underneath is the 'SSID' section, which includes a text input field containing '@Ruijie-sDF9A'. Below the SSID field are two radio buttons for 'Encryption': 'Open' (selected) and 'Security'. Below the encryption options is a dropdown menu for 'Security' set to 'OPEN(Open)'. A message below the SSID section reads: 'No available frequency band? Log in to Ruijie Cloud to add or re-identify the target frequency band. [Re-identify](#) [View Causes](#)'. Below this is a section for 'Country/Region/Time Zone' with two dropdown menus: 'Country/Region' set to 'China (CN)' and 'Time Zone' set to '(GMT+8:00)Asia/Shanghai'. At the bottom of the form are two buttons: 'Previous' and 'Next'.

2.7 Configuration Wizard (Wireless Repeater Mode)

2.7.1 Getting Started

- Before configuring the wireless repeater mode, configure the primary router and test that the primary router can access the Internet.
- Place the device where it can discover at least two-bar Wi-Fi signal of the primary router.

Caution

No Ethernet cable is required in the wireless repeater mode. The wireless network stability can be affected by many factors. Therefore, the wired connection is recommended.

2.7.2 Configuration Steps

- (1) Connect the device to a power supply without connecting an Ethernet cable to the uplink port, and click **Start Setup**.

- (2) If you see a dialogue box indicating that the Ethernet cable is not connected to the WAN port, click **Wireless Repeater**.

2.8 Introduction to the Web Interface

To facilitate flexible device management, the Web page displays different system configuration menus in different work modes. For details about the work mode, see [5.1 Switching Work Mode](#).

As to the RG-RAP72 model, please refer to [2.8.1 Management Page for Wi-Fi 7 Products](#).

The self-organizing network discovery function is enabled by default, but can be disabled manually. After this function is disabled, the web interface displays the local device mode.

When the self-organizing network discovery function is enabled, you can switch between the network-wide mode and the local device mode. The displayed function menus vary with the mode.

Note

After the self-organizing network discovery function is enabled, the system configuration menus on the web interface depends on the master device on the network. If the master device supports Wi-Fi 6 or later, the web interface of the other devices on the network is the same as that of the master device.

2.8.1 Management Page for Wi-Fi 7 Products

1. Enabling Self-Organizing Network Discovery

- Network-Wide Mode: Displays the management information of all devices on the network. You can configure all devices on the network from a network-wide perspective.
- Local Device Mode: You can only configure the current logged in device.

Network-Wide Mode

Local Device Mode

- To access the local device mode for the configuration and management of a single device, perform the following steps:
 - Method 1: Click the device name in the One Device menu and then click Config.

- o Method 2: Choose Network-Wide > Devices and click Manage next to a device in the AP list.

2. Disabling Self-Organizing Network Discovery

If a device is in standalone mode, you can configure and manage only the currently logged in device. The web interface displays the configuration menu of a single device on the left side.

3 Network Monitoring

Choose **Network-Wide > Workspace > Topology**.

The **Overview** webpage displays the current network topology, real-time uplink and downlink flow, networking status, and the number of users. The quick access to network and device settings is also provided on the **Overview** webpage. Users can monitor, configure and manage the network status on the current page.

3.1 Viewing the Network Information

You can view the online device, port ID, device SN as well as the real-time uplink and downlink flow in the network topology.

Physical Topology

- Click the egress gateway to view real-time traffic information of the device.

Traffic Trend

- Click the device in the topology to view the operating status and configuration of the device and configure the device functions. The hostname is set to the product model by default. You can click  to modify the hostname.

- The update time of the topology is displayed at the bottom left corner. Click **Refresh** to update the topology to the latest status. Please wait for a few minutes for the update.

3.2 Adding Network Devices

3.2.1 Wired Connection

- (1) If a new device is connected to the device in the network through wired connection, a prompt message will pop up, indicating that a device not in SON (Self-Organizing Network) is discovered. The number (in orange)

of devices that are not in SON is displayed under the **Devices** at the top left corner of the page. Click **Handle** to add the device to the current network.

(2) Go to the **Network List** page, click **Other Network** to select the target device and click **Add to My Network**.

If the target device is not configured yet, you can add the device directly without a password. If the device is configured with a password, please enter the management password of the device. If the password is incorrect, the device cannot be added to the network.

Add Device to My Network

Add

3.2.2 AP Mesh

1. Overview

After being powered on and enabled with Mesh (see [4.22 Enabling Reyee Mesh](#) for details), a Mesh-capable new AP can be paired with other Mesh-capable wireless devices on the target network through multiple ways. Then the AP will be synchronized its Wi-Fi configuration with other devices automatically. Mesh networking addresses pain points such as complex wireless networking and cabling. A new AP can be connected to any uplink wireless device among AP, EG router, and EGW router in the following ways:

- Button-based pairing: Short press the Mesh button on the EGW router on the target network to implement fast pairing of the AP with the EGW router.
- Search-based pairing: Log in to the web interface of a device on the target network. Search and add APs to be paired.
- Wired pairing: Connect the new AP to a wireless device on the target network using an Ethernet cable. The new AP will go online on the target network.

After pairing finishes, the new AP obtains the wireless backhaul information from network-wide neighboring APs. Install the new AP as planned, and it will connect to the optimal neighboring AP.

2. Configuration Steps

3. Configuration Steps for Button-based Pairing

Caution

- The uplink device is an EGW router.
- Only EG105GW-X and EG105GW(T) support button-based pairing, and each router can be paired with up to 15 new APs.

- The master device must be properly configured. Otherwise, AP mesh failure may occur due to constant channel scanning.
- The new AP must be in factory status.
- It can be scanned only when the live network is enabled with Mesh (see 4.22 [Enabling Reyee Mesh](#) for details).
- Place the new AP no more than 2 meters away from the uplink device to ensure that the new AP can receive the Wi-Fi signal from the uplink device. The new AP may fail to be scanned due to the long distance or obstacles between it and the uplink device.

(1) Power on the new AP and place it near the EGW router on the target network.

(2) Press and hold the Mesh button  on the EGW router for no more than two seconds to start pairing. The pairing process takes about one minute.

(3) Check the topology on the **Physical Topology** page to make sure that the new AP has connected to the uplink device in wireless mode.

(4) Power off the new AP and install it as planned.

(5) Log in to the web interface of a device on the target network. In **Network-Wide** mode, choose **Devices > AP**.

Make sure that the new AP is online and the corresponding entry contains icon  in the **Relay Information** column. The icon indicates that wireless backhaul is performed through the 5 GHz radio.

- (8) Click **View Details** following the  icon to obtain information about the uplink device and RSSI.

The screenshot shows a table of APs with columns for status, name, model, SN, IP, and actions. A red box highlights a detailed view of an AP's status, showing:

- Noise Floor: -82 dBm
- Channel Utilization: 16 %
- RSSI: -26 dBm **Good**
- Negotiation Rate: 173 Mbps
- Uptime: 13 minutes 18 seconds

Below the status box, there are icons for 'Uplink' and 'Local' APs, and a table showing details for two APs:

Model	SN	IP
Model: I...	SN: ZASI...923	IP: 192...155
Model: ...	SN: G1NC...79	IP: 192...31

5. Configuration Steps for Wired Pairing

⚠ Caution

- Uplink device is an AP, EG router, or EGW router.
- The new AP must be in factory status.
- It can be scanned only when the live network is enabled with Mesh (see [4.22 Enabling Reyee Mesh](#) for details).

- (1) Plug one end of the Ethernet cable to the uplink port of the new AP, and the other end to the downlink port of an AP, EG router, or EGW router on the target network. Mesh networking takes one to three minutes. When the system status LED is steady on, it indicates that Mesh networking finishes.
- (2) Log in to the web interface of a device on the target network. In **Network-Wide** mode, choose **Devices** and make sure that the new AP is online.

The screenshot shows a network management interface with a top bar containing filters: All (54), Gateway (1), AP (50), Switch (2), AC (1), Router (0). Below the filters, there is a table of devices with columns: Username, Model, SN, IP Address, MAC Address, Clients, Device Group, and Action.

Username	Model	SN	IP Address	MAC Address	Clients	Device Group	Action
Local	AP	G1...4233	19...15	10:8...E8	0	Default	Manage Reboot

4 Wi-Fi Network Settings

Note

Wi-Fi network settings covers the Wi-Fi settings of the currently logged in devices and the management of all wireless devices in the network. In **Network** mode, the Wi-Fi network settings are synchronized to all wireless devices in the network. You can configure device groups to limit the synchronization range. For details, see [4.1 Configuring AP Groups](#).

4.1 Configuring AP Groups

4.1.1 Overview

After the self-organizing network is enabled, the device can act as the master AP/AC to perform batch configuration and management on the downlink APs in groups. Group the APs before the configurations are delivered.

Note

If you specify a group when setting up a wireless network, the corresponding configuration will take effect on the wireless devices in the specified group.

4.1.2 Configuration Steps

Choose **Network-Wide > Devices > AP**.

(1) The **AP** page displays all APs on the network. Click **Manage** to configure the selected device.

(2) Click **Expand** to view all device groups on the left section of the **Devices** page.

The screenshot shows the top navigation bar with tabs: All (1), Gateway (0), AP (1), Switch (0), AC (0), Router (0). Below the tabs is a status bar with buttons: Select, Reboot, Batch Upgrade, Delete Offline, and a search field. A yellow banner indicates: "Devices outside your network have been discovered. Handle". The main section shows "Group: All Groups" with a red box around the "Expand" button. Other buttons include "Change Group", "Basic Info", "RF Information", and "Model". Below this is a table with columns: Username, Model, SN, IP/MAC, Software Version, Clients, Device Group, and Action. The table contains one entry for a device named "[Master]". The "Action" column has links for "Manage" and "Reboot". At the bottom, it shows "Total 1" and a pagination control set to "10/page".

- (3) Click to create a new group. Up to 8 groups can be added. You can click to edit the group name and click to delete the group. The default group cannot be deleted and its name cannot be edited.

The screenshot shows the same interface as before, but with the "Collapse" button highlighted in a red box. The table now shows two groups: "Default" and "1". The "Default" group has a plus icon and a delete icon. The "1" group has a plus icon and a delete icon. The table content for the "1" group is visible, showing the same device "[Master]".

- (4) Click the group name on the left part to view all devices in this group. A device can only belong to a group. By default, all devices belong to the default group. Select an entry in the list and click **Change Group** to move the target device to a specified group, and then the device will apply the configurations of this group. Click **Delete Offline Devices** to remove the offline device from the list.

The screenshot shows the same interface, but with the "Change Group" button highlighted in a red box. The table now shows a checkbox in the first column for the device "[Master]".

4.2 Adding a Wi-Fi Network

(1) Go to the page for configuration.

- Method 1: Choose **Network-Wide > Workspace > Wireless > Wi-Fi > Wi-Fi List**.
- Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Wi-Fi List**.

(2) Click **Add Wi-Fi**.

Wi-Fi List Healthy Mode

Wi-Fi List Device Group: Default manage **+ Add Wi-Fi**

SSID ?	Band ?	Security ?	Hidden	VLAN ID	Action

Table 4-1 Wi-Fi Configuration Parameters

Parameter	Description
SSID	Enter the name displayed when a wireless client searches for a wireless network.
Purpose	Set the Wi-Fi usage scenario. The options include General , IoT , and Guest . The system will recommend different Wi-Fi parameter combinations based on the selected purpose.

Parameter	Description
Band	Set the band used by the Wi-Fi signal. The options are 2.4 GHz and 5 GHz. The 5 GHz band provides faster network transmission rate and less interference than the 2.4 GHz band, but is inferior to the 2.4 GHz band in terms of signal coverage range and wall penetration performance. Select a proper band based on actual needs. The default value is 2.4G + 5G , indicating that the device provides signals at both 2.4 GHz and 5 GHz bands.
Encryption	The encryption options for a Wi-Fi network include Open , Security , and 802.1x (Enterprise) .
Security	Indicates encryption technologies used to ensure the security of data transmission.
Wi-Fi Password	When the Security is set to WEP, you need to set the password for connecting to the wireless network. The password is a string of 8 to 63 characters.
Select server group	When the Encryption is set to 802. 1x (Enterprise) , you need to configure a remote server set for authentication and authorization.
SSID Encoding	The SSID encoding standard is set to "UTF-8" by default when Chinese characters are included in the SSID. If the Chinese characters are garbled, you can choose "GB2312" as the SSID encoding standard.
Wi-Fi Standard	The Wi-Fi standards include Auto , 802.11be (Wi-Fi 7) , 802.11ax (Wi-Fi 6) , or Compatibility Mode . The final effective Wi-Fi standard depends on the support of Wi-Fi standards on each device. The latest standard is recommended. If there is a compatibility issue, try use an older standard. However, an old standard setting will affect the bandwidth.
MLO	When enabled, MLO-capable clients can connect to multiple frequency bands simultaneously, enhancing the user experience.
802.11r	Enabling the 802. 11r function can shorten the roaming handover time. The 802. 11r function is supported only when Encryption is set to Security or 802. 1x (Enterprise) . Once 802. 11r is enabled, the encryption type can only be WPA2-PSK or WPA2-802.1X.
Schedule	Specify the time periods during which Wi-Fi is enabled. After you set this parameter, users cannot connect to Wi-Fi in other periods.
VLAN	Set the VLAN to which the Wi-Fi signal belongs. You can choose from the available VLANs or click Add New VLAN , and go to the LAN Settings page to add a VLAN.

Parameter	Description
Hide SSID	Enabling the hide SSID function can prevent unauthorized user access to Wi-Fi, improving security. However, mobile phones or computers cannot find the SSID after this function is enabled. You must manually enter the correct name and password to connect to Wi-Fi. Record the current SSID before you enable this function.
Client Isolation	After you enable this parameter, clients associated with the Wi-Fi are isolated from one other, and end users connected to the same AP (in the same network segment) cannot access each other. This improves security.
Band Steering	After this function is enabled, 5G-capable clients select 5G Wi-Fi preferentially. You can enable this function only when Band is set to 2.4G + 5G .
XPress	After this function is enabled, the device sends game packets preferentially, providing more stable wireless network for games.
Layer-3 Roaming	After this function is enabled, clients keep their IP addresses unchanged when associating with the same Wi-Fi. This function improves the roaming experience of users in the cross-VLAN scenario.
LimitSpeed	After enabling Wi-Fi rate limiting, you can set the uplink and downlink rate limits for users. ● Rate Limit Per User: The rate limit applies to all clients connected to the SSID. ● Rate Limit All Users: All clients connected to the SSID share the configured rate limit equally. The rate limit of each client changes dynamically with the number of clients connected to the SSID.

4.3 Configuring SSID and Wi-Fi Password

(1) Go to the page for configuration.

- Method 1: Choose **Network-Wide > Workspace > Wireless > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.

Wi-Fi List Healthy Mode

Wi-Fi List Device Group: Default manage + Add Wi-Fi

SSID ?	Band ?	Security ?	Hidden	VLAN ID	Action
LW_55	2.4G	WPA2-PSK	No	The same VLAN as AP	Edit Delete
1	2.4G 5G	OPEN(Open)	No	The same VLAN as AP	Edit Delete
TEST	2.4G 5G	OPEN(Open)	No	The same VLAN as AP	Edit Delete

Up to 8 SSIDs can be added.

(2) Click the target Wi-Fi network, change the SSID and Wi-Fi password of the Wi-Fi network, and click **OK**.

Caution

After the configuration is saved, all online clients will be disconnected from the Wi-Fi network. You have to enter the new password to connect to the Wi-Fi network.

☒	TEST	2.4G 5G	OPEN(Open)	No	The same VLAN as AP

Up to 8 SSIDs can be added.

- (4) Click **Exit** to exit Wi-Fi network batch management.

Wi-Fi List Healthy Mode

Wi-Fi List Device Group: Default Enable Disable Delete Exit + Add Wi-Fi

☐	SSID ?	Band ?	Security ?	Hidden	VLAN ID
☐	LJW_55	2.4G	WPA2-PSK	No	The same VLAN as AP
☐	1	2.4G 5G	OPEN(Open)	No	The same VLAN as AP
☐	TEST	2.4G 5G	OPEN(Open)	No	The same VLAN as AP

Up to 8 SSIDs can be added.

4.5 Hiding the SSID

4.5.1 Overview

Hiding the SSID can prevent unauthorized clients from accessing the Wi-Fi network and enhance network security. After this function is enabled, the mobile phone or PC cannot search out the SSID. Instead, you have to manually enter the correct SSID and Wi-Fi password. Remember the SSID so that you can enter the correct SSID after the function is enabled.

4.5.2 Configuration Steps

- (1) Go to the page for configuration.

- Method 1: Choose **Network-Wide > Workspace > Wireless > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.

Wi-Fi List Healthy Mode

Wi-Fi List Device Group: Default manage + Add Wi-Fi

☐	SSID ?	Band ?	Security ?	Hidden	VLAN ID	Action
☐	LJW_55	2.4G	WPA2-PSK	No	The same VLAN as AP	Edit Delete
☐	1	2.4G 5G	OPEN(Open)	No	The same VLAN as AP	Edit Delete
☐	TEST	2.4G 5G	OPEN(Open)	No	The same VLAN as AP	Edit Delete

Up to 8 SSIDs can be added.

- (2) Click to expand advanced settings, turn on **Hide SSID** in the expanded settings and click **OK**.

Caution

After the configuration is saved, you have to manually enter the SSID and Wi-Fi password before connecting any device to the Wi-Fi network. Therefore, exercise caution when performing this operation.

Hide SSID ☒ (The SSID is hidden and must be manually entered.)

Client Isolation ☐ (Prevent wireless clients of this Wi-Fi from communicating with one another.)

4.6 Configuring Wi-Fi Band

(1) Go to the page for configuration.

- Method 1: Choose **Network-Wide > Workspace > Wireless > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.

(2) Set the band of Wi-Fi signals. The device supports the 2.4 GHz and 5 GHz bands. Compared with the 2.4 GHz band, the 5 GHz band supports a higher network transmission rate and is less susceptible to interference, but is inferior in signal coverage and through-wall penetration. You can select an appropriate signal band based on actual requirements. The default Wi-Fi band is **2.4G+5G**, indicating that Wi-Fi signals are emitted in both 2.4 GHz and 5 GHz bands.

Edit

4.7 Configuring Band Steering

Caution

This function can be enabled only after the dual-band integration (**Band** is set to **2.4G+5G**) is enabled on the Wi-Fi network. A client automatically selects a band only when the SSIDs of the 2.4 GHz and 5 GHz bands are the same.

(1) Go to the page for configuration.

- Method 1: Choose **Network-Wide** > **Workspace** > **Wireless** > **Wi-Fi** > **Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- Method 2: Choose **One-Device** > **Config** > **WLAN** > **Wi-Fi** > **Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.

(2) Click to expand advanced settings, turn on **Band Steering** in the expanded settings, and click **OK**. After the function is enabled, the client supporting 5 GHz selects the 5G Wi-Fi network preferentially.

The image shows a configuration interface for Wi-Fi settings. At the top, the 'Band' section is highlighted with a red box. It contains three options: '2.4G' (checked), '5G' (checked), and '6G' (unchecked). Below this, a message states: 'No available frequency band? Log in to Ruijie Cloud to add or re-identify the target frequency band. [Re-identify](#) [View Causes](#)'. Below the band settings, the 'Encryption' section shows 'Security' selected. Under 'Security', 'WPA2-PSK' is selected in a dropdown menu. Below that, the 'Wi-Fi Password' field is empty. At the bottom, the 'Band Steering' toggle is turned on (blue), and it is highlighted with a red box. The text next to it says '(The 5G-supported client will access 5G radio preferentially.)'. Below that, the 'XPress' toggle is turned off (grey), with the text '(The client will experience faster speed.)' next to it.

4.8 Configuring Wi-Fi 6

Caution

The function takes effect only on APs supporting the IEEE 802.11ax protocol. In addition, access clients must support IEEE 802.11ax so that clients can enjoy high-speed Internet access experience brought by Wi-Fi 6. If clients do not support Wi-Fi 6, you can disable this function.

(1) Go to the page for configuration.

- Method 1: Choose **Network-Wide > Workspace > Wireless > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
 - Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- (2) Click **advanced Settings** to set the **Wi-Fi Standard** to **802.11ax(Wi-Fi6)**. Click **OK**. After this function is enabled, wireless clients can have faster network speed and optimized network experience.

4.9 Configuring Wi-Fi 7

⚠ Caution

This configuration takes effect only on APs that support the IEEE 802.11be protocol. Clients also need to support the IEEE 802.11be protocol in order to experience high-speed Internet access brought by Wi-Fi 7. Disable this feature if the client does not support Wi-Fi 7.

- (1) Go to the page for configuration.

- Method 1: Choose **Network-Wide > Workspace > Wireless > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
 - Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- (2) Click **advanced Settings** to set the **Wi-Fi Standard** to **802.11be(Wi-Fi7)**. Click **OK**. After this function is enabled, wireless clients can have faster network speed and optimized network experience.

4.10 Configuring Layer-3 Roaming

- (1) Go to the page for configuration.
 - Method 1: Choose **Network-Wide** > **Workspace** > **Wireless** > **Wi-Fi** > **Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
 - Method 2: Choose **One-Device** > **Config** > **WLAN** > **Wi-Fi** > **Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- (2) Click to expand advanced settings, turn on **Layer 3 Roaming** in the expanded settings and click **OK**. The client will keep the IP address unchanged in this Wi-Fi network, improving roaming experience across VLANs.

XPress ☐ (The client will experience faster speed.)

Layer 3 Roaming ☒ (The client will keep the IP address unchanged on the Wi-Fi network.)

LimitSpeed ☐

[Do you want to edit RF parameters? Navigate to Radio Frequency for configuration.](#)

Cancel

OK

4.11 Configuring Client Isolation

- (1) Go to the page for configuration.
 - Method 1: Choose **Network-Wide** > **Workspace** > **Wireless** > **Wi-Fi** > **Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
 - Method 2: Choose **One-Device** > **Config** > **WLAN** > **Wi-Fi** > **Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- (2) Click to expand advanced settings, turn on **Client Isolation** in the expanded settings and click **OK**. The clients joining in this Wi-Fi network will be isolated. The clients associated with the same access point cannot access each other.

Hide SSID ☐ (The SSID is hidden and must be manually entered.)

Client Isolation ☒ (Prevent wireless clients of this Wi-Fi from communicating with one another.)

Band Steering ☐ (The 5G-supported client will access 5G radio preferentially.)

4.12 Configuring 802.11r

Note

MLO and 802.11r are mutually exclusive features. Enabling MLO will automatically disable 802.11r.

The **802.11r** function is available only when the Encryption is set to **Security** or **802.1x(Enterprise)**. Once **802.11r** is enabled, **Security** can only be set to WPA2-PSK or WPA2-802.1X.

(1) Go to the page for configuration.

- Method 1: Choose **Network-Wide > Workspace > Wireless > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.
- Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Wi-Fi List**. Select the Wi-Fi network, and click **Edit**.

(2) Click **advanced Settings**. Enable **802.11r**, and click OK.

Wi-Fi Standard  802.11be(Wi-Fi7) 

MLO   (When enabled, MLO-capable clients can connect to multiple frequency bands simultaneously, enhancing the user experience.)

802.11r   (After this feature is enabled, roaming time is reduced to achieve fast transition.)

4.13 Enabling MLO

Note

- This feature is supported only when there are Wi-Fi 7 APs on the network.
- MLO and 802.11r are mutually exclusive features. Enabling MLO will automatically disable 802.11r.

Multi-Link Operation (MLO) enhances data transmission performance and reduces latency by simultaneously utilizing multiple wireless channels. When enabled, it allows clients to connect to multiple Wi-Fi frequency bands simultaneously.

(1) Go to the configuration page.

- Method 1: Choose **Network-Wide > Workspace > Wireless > Wi-Fi > Wi-Fi List**. Select the desired Wi-Fi network from the list, and click **Edit** in the **Action** column.
- Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Wi-Fi List**. Select the desired Wi-Fi network from the list, and click **Edit** in the **Action** column.

(2) Click to expand advanced settings, toggle on **MLO**, and then click **OK**. When enabled, MLO-capable clients can connect to multiple frequency bands simultaneously, enhancing the user experience.

MLO ? ☒ (When enabled, MLO-capable clients can connect to multiple frequency bands simultaneously, enhancing the user experience.)

802.11r ☐ (After this feature is enabled, roaming time is reduced to achieve fast transition.)

4.14 Configuring a Guest Wi-Fi

4.14.1 Overview

This Wi-Fi network is provided for guests and is disabled by default. It supports client isolation, that is, access clients are isolated from each other. They can only access the Internet via Wi-Fi, but cannot access each other, improving security. The guest Wi-Fi network can be turned off as scheduled. When the time expires, the guest network is off.

4.14.2 Configuration Steps

- Method 1: Choose **Network-Wide** > **Workspace** > **Wireless** > **Wi-Fi** > **Wi-Fi List**.
- Method 2: Choose **One-Device** > **Config** > **WLAN** > **Wi-Fi** > **Wi-Fi List**.

Click **Add Wi-Fi**. Set the purpose to **Guest** and configure the SSID and password. Click **advanced Settings** to configure the effective time of the guest Wi-Fi and other Wi-Fi parameters. After the settings are saved, guests can connect to the Internet through the set SSID and password.

4.15 Configuring Wireless Rate Limiting

4.15.1 Overview

The device supports four rate limiting modes: client-based rate limiting, SSID-based rate limiting, AP-based rate limiting, and packet-based rate limiting. For the same client, if multiple rate limiting modes are configured, the priority order is as follows: client-based rate limiting > SSID-based rate limiting > AP-based rate limiting > packet-based rate limiting.

- **Client-based rate limiting:** This function allows you to limit the rate based on the MAC address of the client, so as to limit or guarantee the bandwidth required by specific clients.
- **SSID-based rate limiting:** This function provides two rate limiting modes for a specified SSID: **Rate Limit Per User** and **Rate Limit All Users**. **Rate Limit Per User** means that all clients connected to the SSID use the same rate limit. **Rate Limit All Users** means that the configured rate limit value is evenly allocated to all clients connected to the SSID. The rate limit value of each client dynamically changes with the number of clients connected to the SSID.
- **AP-based rate limiting:** This function limits the client rates based on the whole network. All clients connected to the network will work according to the configured rate limit value.
- **Packet-based rate limiting:** This function limits the client rates based on the downlink broadcast and multicast packets. The device supports rate limiting for specific broadcast packets (such as ARP and DHCP), multicast packets (such as MDNS and SSDP), or all types of broadcast and multicast packets. If network stalling remains during network access and there is no client with large traffic, you are advised to adjust the rate between 1 kbps and 512 kbps.

4.15.2 Configuration Steps

1. Configuring Client-based Rate Limiting

Choose **Network-Wide > Workspace > Wireless > Rate Limiting > Client-based Rate Limiting**.

(1) Enable **Wireless Rate Limiting**.

Wireless Rate Limiting ☒

Client-based Rate Limiting SSID-based Rate Limiting AP-based Rate Limiting Packet-based Rate Limiting

4.16 Configuring Wi-Fi Blocklist or Allowlist

4.16.1 Overview

You can configure the global or SSID-based blocklist and allowlist. The MAC address supports full match and OUI match.

Wi-Fi blocklist: Clients in the Wi-Fi blocklist are prevented from accessing the Internet. Clients that are not added to the Wi-Fi blocklist are free to access the Internet.

Wi-Fi allowlist: Only clients in the Wi-Fi allowlist can access the Internet. Clients that are not added to the Wi-Fi allowlist are prevented from accessing the Internet.

Caution

If the allowlist is empty, the allowlist does not take effect. In this case, all clients are allowed to access the Internet.

4.16.2 Configuration Steps

1. Configuring a Global Blocklist/Allowlist

Choose **Network-Wide > Workspace > Wireless > Blocklist and Allowlist > Global Blocklist/Allowlist**.

Select the blocklist or allowlist mode and click **Add** to configure a blocklist or allowlist client. Enter the device name, match type, and MAC address of the client to be added to the blacklist or whitelist in the displayed dialog box, and click **OK**. If a client is already associated with the access point, its MAC address will pop up automatically. Click the MAC address directly for automatic input. All clients in the blocklist will be forced offline

and not allowed to access the Wi-Fi network. The global blocklist and allowlist settings take effect on all Wi-Fi networks of the access point.

[Global Blocklist/Allowlist](#) [SSID-Based Blocklist/Allowlist](#)

☒ All STAs except blocklisted STAs are allowed to access Wi-Fi. ☐ Only the allowlisted STAs are allowed to access Wi-Fi.

4.17 Optimizing Wi-Fi Network

4.17.1 Overview

The device detects the surrounding wireless environment and selects the appropriate configuration upon power-on. However, network stalling caused by wireless environment changes cannot be avoided. You can optimize the network with one single click, analyze the wireless environment around the access point and select appropriate parameters.

Caution

After being optimized, the Wi-Fi network will restart, and clients need to reconnect to the Wi-Fi network. Therefore, exercise caution when performing this operation.

4.17.2 Getting Started

Install Wi-Fi Moho or other Wi-Fi scanning app on the mobile phone and check interference analysis results to find out the best channel.

4.17.3 Configuring Global Radio Settings

1. Optimizing the Channel Width

Choose **Network-Wide > Workspace > Wireless > Radio Setting**.

A network with a lower channel width is more stable, while a network with a higher channel width is susceptible to interference. If the interference is severe, choose a lower channel width to avoid network stalling to a certain extent. The access point supports the channel width of 20 MHz and 40 MHz in the 2.4 GHz channel, and the channel width of 20 MHz and 40 MHz and 80 MHz and 160 MHz in the 5 GHz channel.

The default value is **Auto**, indicating that the channel width is automatically selected based on the environment. After changing the channel width, click **Save** to make the configuration take effect immediately.

Caution

In the self-organizing network mode, the channel width settings will be synchronized to all devices in the network.

Radio Setting Device Group: Default [Not solved yet? Click here to access the Network Optimization page for automatic optimization.](#)

Global Radio Settings

Channel Width ? Auto

Multicast Rate (Mbps) ? Auto

Client Count Limit ? 64

Disconnection Threshold ? Disable -85dBm -65dBm

Save

2. Configuring the Multicast Rate

Choose **Network-Wide > Workspace > Wireless > Radio Setting**.

If the multicast rate is too high, the packet loss rate of multicast packets may increase. If the multicast rate is too low, the radio interface may become busy. When network stalling is serious, you are advised to configure a high multicast rate. When network stalling is minor, configure a medium multicast rate. After adjusting the configuration, click **Save**.

Radio Setting Device Group: Default [Not solved yet? Click here to access the Network Optimization page for automatic optimization.](#)

Multicast Rate (Mbps) ? Auto

Client Count Limit ? 64

Disconnection Threshold ? Disable -85dBm -65dBm

Save

3. Configuring the Client Limit

Choose **Network-Wide > Workspace > Wireless > Radio Setting**.

If the access point is associated with too many clients, it will have a lower performance, affecting user experience. After you configure the threshold, new clients over the threshold will not be allowed to access the Wi-Fi network. You can lower the threshold if there is requirement for bandwidth per client. The **Client Count Limit** toggle switch is disabled by default. If there is no need to set a client limit, please keep the default setting.

You can toggle on the **Client Count Limit** toggle switch to set a client limit, and then click **Save**.

Radio Setting

Device Group: Default

Disconnection Threshold ?

Disable -85dBm -65dBm

Save

Note

The **Client Count Limit** refers to the maximum number of clients that can be connected to a single access point.

4. Configuring the Kick-off Threshold

Choose **Network-Wide > Workspace > Wireless > Radio Setting**.

In the case of multiple Wi-Fi signals, setting the kick-off threshold can improve the wireless signal quality to a certain extent. The farther the client is away from the access point, the lower the signal strength is. If the signal is lower than the kick-off threshold, the Wi-Fi will be disconnected, and the client will be forced offline and select a nearer Wi-Fi signal.

However, the higher the kick-off threshold is, the easier it is for the client to be kicked offline. To ensure normal Internet access, you are advised to disable the kick-off threshold or set the value to less than -75dBm. After adjusting the configuration, click **Save**.

4.17.4 Configuring Standalone Radio Settings

Go to the configuration page.

- Method 1: Choose **One-Device > Config > WLAN > Radio Setting**.
- Method 2: Choose **Network-Wide > Devices> Manage > Config > WLAN > Radio Setting**.

In high-density client environments, you can fine-tune radio settings to alleviate radio frequency interference resulting from too many access points in close proximity. This include disabling the radio of neighboring APs that are causing significant interference, aiming to minimize signal conflicts and enhance the overall quality and stability of wireless communication.

In environments like conference rooms, offices, and smart homes, disabling the 2.4GHz radio of specific APs can enhance the performance of wireless devices such as mice, keyboards, Bluetooth and Zigbee devices when they experience signal interference or operational lag.

The **Radio Switch** is enabled by default, and can be disabled as required.

- Method 1: Choose **One-Device** > **Config** > **WLAN** > **Radio Setting**.
- Method 2: Choose **Network-Wide** > **Devices** > **Manage** > **Config** > **WLAN** > **Radio Setting**.

A greater transmit power indicates a larger coverage and brings stronger interference to surrounding wireless routers. In a high-density scenario, you are advised to set the transmit power to a small value. The **Auto** mode is recommended, indicating automatic adjustment of the transmit power. After adjusting the configuration, click **Save**.

Radio Parameters

3. Configuring the Roaming Sensitivity

- Method 1: Choose **One-Device** > **Config** > **WLAN** > **Radio Setting**.
- Method 2: Choose **Network-Wide** > **Devices** > **Manage** > **Config** > **WLAN** > **Radio Setting**.

The roaming sensitivity enables the device to actively disconnect a client from the Wi-Fi network when the client is far away, forcing the client to re-select the nearest signal and thus improving the sensitivity of wireless roaming. Higher the roaming sensitivity level, smaller the wireless signal coverage. To improve the signal quality for a client moving within more than one Wi-Fi coverage, improve the roaming sensitivity level. You are advised to keep the default settings. After adjusting the configuration, click **Save**.

4.17.6 Configuring Wi-Fi Roaming Optimization (802.11k/v)

Choose **Network-Wide > Workspace > WLAN Optimization > 802.11k/v Roaming Optimization**.

Choose the optimization mode. Click **Enable** and the Wi-Fi roaming is further optimized through the 802.11k/v protocol. Smart clients compliant with 802.11k/v can switch to the APs with better signal and faster speed during the roaming process, ensuring high-speed wireless connectivity. To ensure smart roaming effect, the WLAN environment will be auto scanned when Wi-Fi roaming optimization is first enabled.

Caution

- WIO is supported only in the self-organizing network mode.
- During the WLAN environment scanning, the APs will switch channels, forcing the clients to go offline. The process will last for 2 minutes.

4.18 Configuring IGMP Snooping

4.18.1 Overview

1. IGMP Snooping

IGMP snooping allows switches to listen for and analyze IGMP (Internet Group Management Protocol) messages in order to determine which switch ports are connected to hosts that are interested in specific multicast groups. By forwarding multicast traffic only to these ports, IGMP snooping helps to prevent unnecessary flooding of multicast traffic to all ports on the network, thereby improving network efficiency and security.

2. Unknown Multicast Packet

Unknown multicast packets are multicast packets transmitted on a network, whose destination addresses are multicast group addresses that are not learned or identified by the switch.

4.18.2 Configuration Steps

Choose **Network-Wide > Workspace > WLAN Optimization > Advanced Settings**.

Enable **IGMP Snooping**, select the action for unknown multicast packets, and click **Save**.

Network Optimization Scheduled Optimization Optimization Record 802.11k/v Roaming Optimization **Advanced**

IGMP Snooping Device Group: Default

When this feature is enabled, the AP converts multicast packets to unicast packets for a higher data rate and reduced airtime usage.
To enhance user experience, you are advised to enable this feature in scenarios with high multicast traffic on air interfaces or slow network connections.
Setting the unknown multicast action to "Discard" may lead to dropping of multicast packets sent by specific clients. In such cases, set the unknown multicast action to "Flood" for those specific clients.

IGMP Snooping ☒

Unknown Multicast Flood

Action

[Save](#)

Caution

- You are advised to enable this function when a large number of multicast packets are transmitted and the network is congested to improve the user experience.
- If you set the action for unknown multicast packets to **Discard**, multicast packets sent by certain clients may be discarded. Therefore, exercise caution when performing this configuration.

4.19 Configuring Healthy Mode

Go to the configuration page:

- Method 1: **Choose Network-Wide > Workspace > Wireless > Wi-Fi > Healthy Mode.**
- Method 2: Choose **One-Device > Config > WLAN > Wi-Fi > Healthy Mode.**

Select **Device Group** from the drop-down list box. Click **Enable** to enable the healthy mode. You are allowed to set the effective time period for the healthy mode.

After the healthy mode is enabled, the transmit power and the Wi-Fi coverage area will decrease. The healthy mode may reduce signal strength and cause network stalling. You are advised to disable it or enable it when the network is idle.

4.22 Enabling Reyee Mesh

Choose **Network-Wide > Workspace > Wireless > AP Mesh**.

After Reyee Mesh is enabled, you can set up a Mesh network through Mesh pairing between the devices that support Reyee Mesh. You can press the **Mesh** button on the device to automatically discover a new device for Mesh pairing or log in to the management page to select a new device for Mesh pairing. Reyee Mesh is enabled on the device by default.

After Reyee Mesh is enabled, the devices that support Reyee Mesh can be paired through wireless or wired connection to set up a Mesh network. Auto link optimization is supported in the Mesh network.

- ! Mesh link optimization algorithm: The algorithm not only covers signal strength, wireless mode, antenna streams and bandwidth parameters, but also considers the attenuation of Mesh hops. The Mesh system will select the optimal uplink automatically for the AP based on the link optimization algorithm.

Enable ☒

Save

4.23 Domain Proxy

Go to the configuration page:

- Method 1: Choose **Network-Wide > Workspace > Wireless > Domain Proxy**.
- Method 2: Choose **One-Device > Config > WLAN > Domain Proxy**.

Note

The method 2 is supported only when the AP is the master device.

When a client accesses a Wi-Fi network, the message "No Internet connection" or "The Wi-Fi is not connected to the Internet" may be displayed. The possible cause is that the client's operating system introduces an Internet detection mechanism. Generally, the detection mechanism sends a probe packet to a specified domain name

and evaluates whether the wireless network can access the Internet based on the detection result. If the DNS server takes a long time to parse a domain name or returns a probe node with a long delay, the probe may be deemed unreachable, causing a false network unavailability.

After the **Domain Proxy** function is enabled, the device returns the preset domain name node to the client, reducing the misjudgment of network unavailability of the client.

The **Forced Association** feature may cause the client to go offline or fail to associate with the AP. Therefore, exercise caution when performing this configuration.

4.25 Configuring AP Load Balancing

4.25.1 Overview

The AP load balancing function is used to balance the load of APs in the wireless network. When APs are added to a load balancing group, clients will automatically associate with the APs with light load when the APs in the group are not load balanced. AP load balancing supports two modes:

- **Client Load Balancing:** The load is balanced according to the number of associated clients. When a large number of clients have been associated with an AP and the count difference to the AP with the lightest load has reached the specified value, the client can only associate with another AP in the group.
- **Traffic Load Balancing:** The load is balanced according to the traffic on the APs. When the traffic on an AP is large and the traffic difference to the AP with the lightest load has reached the specified value, the client can only associate with another AP in the group.

Example: Add AP1 and AP2 into a group and select client load balancing. Set both the client count threshold and difference to 3. AP1 is associated with 5 clients and AP2 is associated with 2 clients, triggering load balancing. New clients' attempt to associate to AP1 will be denied, and therefore they can associate only with AP2.

After a client request is denied by an AP and it fails to associate with another AP in the group, the client will keep trying to associate with this AP. If the client attempts reach the specified value, the AP will permit connection of this client, ensuring that the user can normally access the Internet.

4.25.2 Configuring Client Load Balancing

Choose **Network-Wide > Workspace > Wireless > Load Balancing**.

Click **Add**. In the dialog box that appears, set **Type** to **Client Load Balancing**, and configure **Group Name**, **Members**, and **Rule**.

Load Balancing

[+ Add](#)[Delete Selected](#)

By grouping APs in the same area into a load balancing group, they can collaborate to control the access of wireless clients and to achieve optimal traffic distribution.

For example, when AP1 and AP2 are added to the same load balancing group, with the load balancing type set to Client Load Balancing and a strategy to trigger load balancing when one AP has 3 clients and the load-balancing threshold is 3, if AP1 has 5 clients and AP2 has 2 clients, any new client trying to connect to AP1 will be denied access and redirected to AP2, achieving load balancing between the two APs.

By default, when the traffic load on an AP reaches 500 Kbit/s and the difference between the current traffic and the traffic on the AP with the lightest load reaches 500 Kbit/s, clients can associate only to another AP in the group. After a client association is denied by an AP for 10 times, the client will be allowed to associate to the AP upon the next attempt.
Members	Specify the APs to be added to the AP load balancing group.

4.26 Wireless Authentication

4.26.1 Overview

Wireless authentication verifies the identity of users on a wireless network. Only authenticated users can access the network, ensuring wireless network security. You can configure authentication-free for wireless STAs (IP address/MAC address), public IP addresses, and domain names. Users can directly use network services or access specific websites without entering the username, password, or other information.

To use the wireless authentication function, ensure that the AP is added to Ruijie Cloud and is online. Then, configure a portal template on Ruijie Cloud and apply it to a specific SSID. When STAs connect to this SSID and access the network, the AP allows STAs added to the authentication-free lists configured on the web interface (excluding those added to the MAC address blocklist) to access the network without authentication. The AP forbids STAs whose MAC addresses are added to the MAC address blocklist configured on the web interface from accessing the network. For other users or domain names, the AP redirects them to the portal authentication page. Users need to complete identity verification on the portal page.

The following four authentication modes are supported:

- One-click Login: indicates login without the username and password.
- Voucher: indicates login with a random eight-digit password.
- Account: indicates login with the account and password.
- SMS: indicates login with the phone number and code.

Two or more authentication modes can be configured in a portal template. When multiple authentication modes are configured, users can select an authentication mode on the portal page.

4.26.2 Configuring One-click Login on Ruijie Cloud

1. Configuring a Portal Template with the Authentication Mode Set to One-click Login

- (1) Log in to Ruijie Cloud, choose **Project > Configuration > Auth & Accounts > Authentication > Captive Portal**, and select a network that needs to configure wireless authentication.
- (2) Click **Add Captive Portal** to open the portal template configuration page.

Policy Mode	Indicates the authentication mode to which the captive portal applies: Inner: Cloud-based authentication. The built-in authentication server in the public cloud is used for authentication. Local: Device-based local authentication and acceleration. Portal pages and accounts in the cloud are synchronized with the device for local authentication and acceleration. External: Third-party authentication, facilitating integration between the device and a third-party authentication server for authentication.

Parameter	Description
Authentication Device	Indicates the device that performs the authentication. When there is a router on the network, you are advised to enable authentication on the router. You can perform authentication on either an access point (AP) or a router. AP: An AP acts as the N/AS. Router: A router or gateway acts as the N/AS responsible for performing authentication at the gateway exit. Reyee AP Authentication: RAP, ReyeeOS 1.219 or later version. This parameter is not required if the policy mode is Local.
Network	Indicates the wired network that requires authentication. Enter the network segment in this field. Users connecting to the wired network corresponding to this network segment must be authenticated. This parameter is required if the Authentication Device is Router.
SSID	Indicates the network name of the Wi-Fi network that requires authentication. Users connecting to this wireless network must be authenticated. This parameter is required if the Authentication Device is AP.
Seamless Online	After this function is enabled, if the first authentication is successful, subsequent connections to this Wi-Fi network will automatically be authenticated within a certain period of time.
Seamless Online Period	Indicates the time period for seamless online. If the first authentication is successful, subsequent connections to this Wi-Fi network will automatically be authenticated within this period of time.
Portal Page	Indicates the portal page that is displayed after portal authentication. Click Current Project to select the portal page for an existing project. Click Shared Portals to select an existing portal page. Click Add Page to customize a portal page.

3. Adding a Voucher

- (1) Log in to Ruijie Cloud, choose **Project > Auth & Accounts > Accounts > User Management**, and select a network in this account.
- (2) Configure a user group.
 - a On the **User Group** tab, click **Add**.

b Configure user group parameters. After the configuration, click **OK**.

Add user group

OK

User Group Name: indicates the user group name.

Price: indicates the price of the user group. Mark user groups by numeral. The current version has no impact on network usage.

Concurrent Devices: indicates the number of concurrent devices for one account.

Period: indicates the maximum validity time of an account. The maximum value is counted after the client passes authentication and successfully accesses the Internet.

Quota: indicates the maximum amount of data transfer.

Maximum upload rate: indicates the maximum upload rate.

Maximum download rate: indicates the maximum download rate.

Bind MAC on first use: indicates that the MAC address of the first device used will be bound and other devices used by the same user will be prohibited from accessing the Internet.

(3) Configure a voucher.

- a On the **Voucher** tab, click **Add voucher**.

- b Configure voucher parameters. After the configuration, click **OK**.

4.26.7 Configuring an Authentication-Free User List on Web Interface

You can configure authentication-free for wireless STAs (IP address/MAC address), public IP addresses, and domain names. Users can directly use network services or access specific websites without entering the username, password, or other information.

1. Configuring an Authentication-Free User

- (1) Choose **Network-Wide > Workspace > Wireless > Wireless Auth > Allowlist > User Allowlist**.
- (2) Click **Add** to open the configuration page.

- (3) Configure an STA IP address or IP address range. After the configuration, click **OK** to save the configurations.

Add

✕

* IP / IP Range

Example: 1.1.1.1-1.1.1.100

Cancel

OK

2. Configuring an Authentication-Free Public IP Address

- (1) Choose **Network-Wide > Workspace > Wireless > Wireless Auth > Allowlist > IP Allowlist**.
- (2) Click **Add** to open the configuration page.

Cloud Integration [Allowlist](#) Client List

i A user configured with whitelisted IP or MAC address can access the Internet without authentication.

User Allowlist **IP Allowlist** Domain Allowlist MAC Blocklist/Allowlist

IP Allowlist + Add [Delete Selected](#)

Up to **50** entries can be added.

IP / IP Range	Action
No Data	

< **1** > 10/page Total 0

- (3) Configure a public IP address or public IP address range. After the configuration, click **OK** to save the configurations.

Add

✕

* IP / IP Range

Example: 1.1.1.1-1.1.1.100

Cancel

OK

3. Configuring a Domain Name Allowlist

- (1) Choose **Network-Wide > Workspace > Wireless > Wireless Auth > Allowlist > Domain Allowlist**.
- (2) Click **Add** to open the configuration page.

Cloud Integration **Allowlist** Client List

i A user configured with whitelisted IP or MAC address can access the Internet without authentication.

User Allowlist IP Allowlist **Domain Allowlist** MAC Blocklist/Allowlist

Domain Allowlist + Add Delete Selected

Up to **100** entries can be added.

	URL	Action
	No Data	

< 1 > 10/page Total 0

(3) Configure authentication-free websites. After the configuration, click **OK**.

Add ×

* URL

Cancel OK

4. Configuring a MAC Address Allowlist and Blocklist

STAs whose MAC addresses are added to the MAC address allowlist can access the network without authentication, and STAs whose MAC addresses are added to the MAC address blocklist are forbidden to access the network.

- (1) Choose **Network-Wide > Workspace > Wireless > Wireless Auth > Allowlist > MAC Blocklist/Allowlist**.
- (2) Click **Add** to open the MAC address allowlist or blocklist configuration page.

Cloud Integration **Allowlist** Client List

i A user configured with whitelisted IP or MAC address can access the Internet without authentication.

4.27 Configuring 802.1X Authentication

4.27.1 Overview

IEEE 802.1X is a port-based network access control standard that provides secure access services for LANs.

On an IEEE 802 LAN, a user can directly access network resources without authentication and authorization as long as it can connect to a network device. This uncontrolled behavior can bring security risks to the network. The IEEE 802.1X protocol was proposed to address the security issues on an IEEE 802 LAN.

The IEEE 802.1X protocol supports three security applications: Authentication, Authorization, and Accounting, abbreviated as AAA.

- **Authentication:** Determines whether a user can obtain access, and restricts unauthorized users.
- **Authorization:** Authorizes services available for authorized users, and controls the permissions of unauthorized users.
- **Accounting:** Records the usage of network resources by users, and provides a basis for traffic billing.

The 802.1X feature can be deployed on networks to control user authentication, authorization, and more.

An 802.1X network uses a typical client/server architecture, consisting of three entities: client, access device, and authentication server. A typical architecture is shown here.

Figure 4-1 Typical Architecture of 802.1X Network

- The client is usually an endpoint device which can initiate 802.1X authentication through the client software. The client must support the Extensible Authentication Protocol over LANs (EAPoL) on the local area network.
- The access device is usually a network device (AP or switching device) that supports the IEEE 802.1X protocol. It provides an interface for clients to access the local area network, which can be a physical or a logical interface.
- The authentication server can realize user authentication, authorization, and accounting. Usually a RADIUS server is used as the authentication server.

Note

The RG-RAP APs only support the authentication.

4.27.2 Configuring 802.1X Authentication

- (1) Choose **Network-Wide > Workspace > Wireless > 802.1x Authentication**.
- (2) Click **Global 802.1x**. A pop-up window is displayed. Click **OK**.

Enable the **Escape SSID** and configure parameters such as Escape SSID. Users can temporarily connect to the Escape SSID without a password when the authentication server is unavailable.

Escape SSID ☒

* Escape SSID

* Security

* Wi-Fi Password

Toggle on **Re-authentication** and set the re-authentication interval. The re-authentication function performs periodic user authentication, and users who do not pass the periodic authentication will be disconnected.

Caution

The re-authentication interval must be set to 10800 seconds or above.

Re-authentication ☒

* Re-auth Interval s

Client Packet Timeout Duration: The time limit for a client to wait for a response from the server. An authentication failure occurs after this time limit expires. The value range is 1 to 65535 seconds.

(3) Add a server.

Before proceeding, make sure that the following conditions are met:

- The RADIUS server is ready and the following configurations have been completed.
 - A username and a password have been added for client login.
 - The firewall has been disabled. Otherwise, authentication messages may be blocked, leading to authentication failure.
 - The IP address of the device to be authenticated has been added as a trusted IP address on the RADIUS server.
 - The network between the device and the RADIUS server is reachable.
 - The IP addresses of the RADIUS server and the device to be authenticated have been obtained.
- Click **Add Server group** to configure server group parameters. You can click **Edit** to edit the server group, and click **Delete** to delete the server group.

Note

- You need to add at least one server for each server group, and a maximum of five servers can be added.
- Up to 20 server groups can be added under **RADIUS Server Management**.

5 Network Settings

**Note**

This chapter takes the currently logged in device as an example to describe the entry of each function setting page. If you need to configure other devices in the network, please refer to the following path to enter the configuration page of the corresponding device, and then configure the function: For RG-RAP72: Click [3.3 Managing Network Devices](#).

5.1 Switching Work Mode

5.1.1 Work Mode

See [2.4 Work Mode](#) for details.

5.1.2 Self-Organizing Network Discovery

When setting the work mode, you can set whether to enable the self-organizing network discovery function. This function is enabled by default.

After the self-organizing network discovery function is enabled, the device can be discovered in the network and discover other devices in the network. Devices network with each other based on the device status and synchronize global configuration. You can log in to the Web management page of any device in the network to check information about all devices in the network. After this function is enabled, clients can maintain and manage the current network more efficiently. You are advised to keep this function enabled.

If the self-organizing network discovery function is disabled, the device will not be discovered in the network and it runs in local device mode. After logging in to the Web page, you can configure and manage only the currently logged in device. If only one device is configured or global configuration does not need to be synchronized to the device, you can disable the self-organizing network discovery function.

5.1.3 Configuration Steps

**Note**

If you need to switch the work mode to wireless bridging mode, please see [5.5.2 Wireless Repeater](#) for details.

Go to the configuration page:

- Method 1: Choose **One-Device**. Click the device model.
- Method 2: Choose **Network-Wide** > **Devices** > **AP**. Select the target device in the list and click **Manage**.

Click the current work mode to change the work mode.

AC function switch: If a device works in the router mode and the self-organizing network discovery function is enabled, you can enable or disable the AC function. After the AC function is enabled, the device in the router mode supports the virtual AC function and can manage downlink devices. If this function is disabled, the device needs to be elected as an AC in self-organizing network mode and then manage downlink devices.

Working Mode

×

Description:

1. The device IP address may change upon mode change.
2. Change the endpoint IP address and ping the device.
3. Enter the new IP address into the address bar of the browser to access Eweb.
4. The system menu varies with different work modes.

The device supports the following Internet connection types:

- **PPPoE**: This Internet connection type is supported only when the device works in routing mode. You need to manually configure the PPPoE username and password.
- **DHCP**: The current device will act as a DHCP client and apply for the IPv4 address/prefix from the upstream network device.
- **Static IP**: If this Internet connection type is selected, you need to manually configure a static IPv4 address, subnet mask, gateway address, and DNS server.

5.3 Configuring Internet Connection Type (IPv6)

Caution

This function is supported when the device works in AP mode.

Go to the configuration page:

- Method 1: Choose **One-Device** > **Config** > **Network** > **WLAN** > **WAN_V6 Settings**.
- Method 2: Choose **Network-Wide** > **Workspace** > **Wired** > **WAN** > **WAN_V6 Settings**.

Select the Internet connection type after confirming with the ISP. After completing the configuration, click **Save**.

The screenshot shows the 'WAN_V6 Settings' configuration page. At the top, there are tabs for 'WAN' and 'WAN_v6 Settings'. Below the tabs, there is a form with several fields: 'Internet' (a dropdown menu currently showing 'Null'), 'IPv6 Address', 'IPv6 Prefix', 'Gateway', and 'DNS Server'. A dropdown menu is open for the 'Internet' field, showing three options: 'DHCP', 'Static IP', and 'Null' (which is highlighted in blue). At the bottom of the form, there is a blue 'Save' button.

The device supports the following Internet connection types:

- **DHCP**: The current device will act as a DHCPv6 client and apply for the IPv6 address/prefix from the upstream network device.
- **Static IP**: If this Internet connection type is selected, you need to manually configure a static IPv6 address, gateway address, and DNS server.
- **Null**: The IPv6 function is disabled on the current WAN port.

5.4 Configuring LAN Port

Caution

This function is not supported when the device works in AP mode.

Go to the configuration page:

- Method 1: Choose **One-Device** > **Config** > **Network** > **LAN** > **LAN Settings**.
- Method 2: Choose **Network-Wide** > **Workspace** > **Wired** > **LAN** > **LAN Settings**.

Click **Edit**. In the displayed dialog box, enter the IP address and subnet mask, and click **OK**. Change the IP address of the LAN port. Enter the new IP address in the browser and log in to the device again to configure and manage the device.

Table 5-1 LAN Settings

Parameter	Description
IP Address	Default gateway for devices connected to the Internet through this LAN.
Subnet Mask	Subnet mask of devices on the LAN.
VLAN ID	VLAN ID.
Remarks	VLAN description.
DHCP Server	After this function is enabled, devices on the LAN can automatically obtain the IP address. You need to configure the start IP address, IP count and lease time, as well as DHCP server options. For details, see 5.9 Configuring DHCP Server
Start IP Address	Start IP address that a DHCP server automatically assigns to clients. The start IP address must be within the network segment calculated based on the IP address and subnet mask.
IP Count	The number of assignable IP addresses depends on the LAN segment and the start IP address.
Lease Time (Min)	Lease time of the automatically assigned IP addresses. When the lease time expires, devices on the LAN will obtain IP addresses again.

5.5 Configuring Repeater Mode

5.5.1 Wired Repeater

Choose **One-Device**. Click the device mode, and then choose **Config > Network > Work Mode**.

Connect a network cable from the WAN port (uplink LAN port) of the device to the upper-layer device.

Select **Access Point**, click **Check**, confirm the Wi-Fi settings of the AP, and then click **Save** to expand the network coverage.

Caution

After the configuration is saved, connected clients will be disconnected from the network for a short period of time. You can reconnect the clients to the Wi-Fi network for restoration.

The device is working in **Access Point** mode.

☐ Router ☒ Access Point ☐ Wireless Repeater

This mode allows you to establish a wired connection between a primary router and a secondary router, extending network coverage.
 Cable Connection: Please connect the WAN port of the local router to the LAN port of the primary router.
Tip: The local router is a secondary router. The local router Wi-Fi is managed by the primary router.

Edit

5.5.2 Wireless Repeater

The wireless repeater mode extends the Wi-Fi coverage range of the primary device. The device supports the dual-link wireless repeater mode and can extend both 2.4 GHz and 5 GHz signals of the primary device.

Note

- To avoid loops in wireless repeater mode, remove the network cable from the WAN port.
 - Obtain the Wi-Fi name and Wi-Fi password of the upper-layer router.
-

Choose One-Device. Click the device mode, and then choose **Config > Network > Work Mode**.

Click **Wireless Repeater** and then click **Select**. A list of surrounding Wi-Fi signals pops up. A list of nearby 5 GHz Wi-Fi networks is displayed by default. You can switch from 5 GHz to 2.4 GHz band by selecting **2.4G** from the drop-down list box. You are advised to select a strong 5 GHz Wi-Fi network signal.

The device is working in **Access Point** mode.

☐ Router

☐ Access Point

☒ **Wireless Repeater**

-
- This mode allows you to establish a wireless connection between the primary device and the local device that works as the secondary device, extending network coverage.
 - You are advised to select a 5G Wi-Fi of the primary device for better Internet experience.
- To avoid loops, wireless repeater is not allowed to be configured.

Table 5-2 VLAN Configuration Parameters

Parameter	Description
IP Address	IP address of the VLAN interface. The default gateway of devices that access the Internet through the current LAN should be set to this IP address.
Subnet Mask	Subnet mask of the IP address of the VLAN interface.
VLAN ID	VLAN ID.

Parameter	Description
Remark	VLAN description.
MAC	MAC address of the VLAN interface.
DHCP Server	Enable the DHCP server function. After it is enabled, devices on the LAN can automatically obtain IP addresses. After the DHCP service is enabled, you need to configure the start IP address to be assigned, number of IP addresses to be assigned, and address lease term for the DHCP server, and other DHCP server options. For details, see 5.9 Configuring DHCP Server .

Caution

VLAN configuration is associated with the configuration of the uplink device. Therefore, refer to the configuration of the uplink device when configuring a VLAN.

5.7 Changing MAC Address

Go to the configuration page:

- Method 1: Choose **One-Device > Config > Network > WAN > WAN**.
- Method 2: Choose **Network-Wide > Workspace > Wired > WAN > WAN**.

ISPs may restrict the access of devices with unknown MAC addresses to the Internet for the sake of security. In this case, you can change the MAC address of the WAN port.

Click to expand **Advanced Settings**, enter the MAC address, and click **Save**. You do not need to change the default MAC address unless in special cases.

In the router mode, change the MAC address of the LAN port on **LAN > LAN Settings**.

Caution

Changing the MAC address will disconnect the device from the network. You need to reconnect the device to the network or restart the device. Therefore, exercise caution when performing this operation.

----- Advanced Settings -----

VLAN ID

* MTU 

* MAC Address 

5.8 Changing MTU

Go to the configuration page:

- Method 1: Choose **One-Device > Config > Network > WAN > WAN**.
- Method 2: Choose **Network-Wide > Workspace > Wired > WAN > WAN**.

WAN interface MTU indicates the maximum transmission unit (MTU) allowed by the WAN interface. The default value is 1500 bytes, indicating the maximum data forwarding efficiency. Sometimes, ISP networks restrict the speed of large data packets or forbid large data packets from passing through. As a result, the network speed is unsatisfactory or even the network is disconnected. In this case, you can set the MTU value to a smaller value.

----- Advanced Settings -----

VLAN ID	Enter a VLAN ID in the range of 2-23
* MTU ?	1500
* MAC Address ?	

5.9 Configuring DHCP Server

Caution

This function is not supported when the device works in AP mode.

5.9.1 DHCP Server

In the router mode, the DHCP server function can be enabled on the device to automatically assign IP addresses to clients so that clients connected to the LAN ports or Wi-Fi network of the device obtain IP addresses for Internet access.

5.9.2 Configuring the DHCP Server Function

Go to the configuration page:

- Method 1: Choose **One-Device > Config > Network > LAN > LAN Settings**.
- Method 2: Choose **Network-Wide > Workspace > Wired > LAN > LAN Settings**.

DHCP Server: The DHCP server function is enabled by default in the router mode. You are advised to enable the function if the device is used as the sole router in the network. When multiple routers are connected to the upper-layer device through LAN ports, disable this function.

Caution

If the DHCP server function is disabled on all devices in the network, clients cannot automatically obtain IP addresses. You need to enable the DHCP server function on one device or manually configure a static IP address for each client for Internet access.

Start: Enter the start IP address of the DHCP address pool. A client obtains an IP address from the address pool. If all the addresses in the address pool are used up, no IP address can be obtained from the address pool.

IP Count: Enter the number IP addresses in the address pool.

Lease Time(Min): Enter the address lease term. When a client is connected, the leased IP address is automatically renewed. If a leased IP address is not renewed due to client disconnection or network instability, the IP address will be reclaimed after the lease term expires. After the client connection is restored, the client can request an IP address again. The default lease term is 30 minutes.

5.10 Configuring DNS

Choose **One-Device > Config > Advanced > Local DNS**.

Enter the IP address of the DNS server and click **Save**. The local DNS server is optional. The device obtains the DNS server address from the connected uplink device by default. The default configuration is recommended. The available DNS service varies from region to region. You can consult the local ISP.

 The local DNS server is not required to be configured. By default, the device will get the DNS server address from the uplink device.

5.14 Configuring ARP Binding

Caution

This function is not supported when the device works in AP mode.

The device learns the IP and MAC addresses of network devices connected to ports of the device and generates ARP entries. You can bind ARP mappings to improve network security.

Choose **One-Device** > **Config** > **Security** > **ARP List**.

ARP mappings can be bound in two ways:

- (1) Select a dynamic ARP entry in the ARP list and click **Bind**. You can select multiple entries to be bound at one time and click **Bind Selected** to bind them. To remove the binding between a static IP address and a MAC address, click **Delete** in the **Action** column.

ARP List

5.15 Configuring LAN Ports

 Caution

The configuration takes effect only on APs having wired LAN ports.

Choose **Network-Wide > Workspace > Wireless > LAN Ports**.
Enter the VLAN ID and click **Save** to configure the VLAN, to which the AP wired ports belong. If the VLAN ID is null, the wired ports and WAN port belong to the same VLAN.

This profile takes effect only on APs with wired LAN ports, and is subject to the actual device. For example, the AP wired port profile takes effect on the RG-EAP101 AP.

Note: This profile takes effect on APs on the AP Wired Port Profile List. The AP Wired Profile Default Profile takes effect on other APs on the network.

5.16 IPv6 Settings

Caution

This function is supported when the device works in router mode.

5.16.1 Overview

Internet Protocol Version 6 (IPv6) is the next generation IP protocol designed by the Internet Engineering Task Force (IETF) to replace IPv4 and solve the IPv4 problems such as address depletion.

5.16.2 IPv6 Basic

1. IPv6 Address Format

IPv6 increases the length of the address from 32 bits in IPv4 to 128 bits, and therefore has a larger address space than IPv4.

The basic format of an IPv6 address is **X:X:X:X:X:X:X**. The 128-bit IPv6 address is divided into eight 16-bit sections that are separated by colons (:), and 16 bits in each section are represented by four hexadecimal characters (0–9 and A–F). Each **X** represents a 4-character hexadecimal number.

For example: 2001:ABCD:1234:5678:AAAA:BBBB:1200:2100, 800:0:0:0:0:0:1, 1080:0:0:0:8:800:200C:417A

The number **0** in the IPv6 address can be abbreviated as follows:

- The starting 0s can be omitted. For example, 2001:00CD:0034:0078:000A:000B:1200:2100 can be written as 2001:CD:34:78:A:B:1200:2100.
- Consecutive 0s can be replaced by two colons (::). For example, **800:0:0:0:0:0:1** can be written as **800::1**. Consecutive 0s can be replaced by two colons only when the 16-bit section contains all 0s, and the two

colons can only appear once in the address.

2. IPv6 Prefix

An IPv6 address consists of two parts:

- Network prefix: It contains n bits, and is equivalent to the network ID in an IPv4 address.
- Interface identifier: It contains $(128 - n)$ bits, and is equivalent to the host ID in an IPv4 address.

The length of the network prefix is separated from the IPv6 address by a slash (/). For example, **12AB::CD30:0:0:0/60** indicates that the length of the prefix used for routing in the address is 60 bits.

3. Special IPv6 Address

There are also some special IPv6 addresses, for example:

fe80::/8 is a link local address, and equivalent to 169.254.0.0/16 in IPv4.

fc00::/7 is a local address, and similar to 10.0.0.0/8, 172.16.0.0/16, or 192.168.0.0/16 in IPv4.

ff00::/12 is a multicast address, and similar to 224.0.0.0/8 in IPv4.

4. NAT66

IPv6-to-IPv6 Network Address Translation (NAT66) is the process of converting the IPv6 address in an IPv6 packet header to another IPv6 address. NAT66 prefix translation is an implementation of NAT66. It replaces the IPv6 address prefix in the packet header with another IPv6 address prefix to achieve IPv6 address translation. NAT66 can realize mutual access between an intranet and Internet.

5.16.3 IPv6 Address Assignment Methods

- Manual configuration: The IPv6 address/prefix and other network configuration parameters are manually configured.
- Stateless Address Autoconfiguration (SLAAC): The link local address is generated based on the interface ID, and then the local address is automatically configured based on the prefix information contained in the route advertisement packet.
- Stateful address autoconfiguration, that is, DHCPv6: DHCPv6 is divided into the following two types:
 - DHCPv6 autoconfiguration: The DHCPv6 server automatically configures the IPv6 address/prefix and other network configuration parameters.
 - DHCPv6 Prefix Delegation (PD): The lower-layer network device sends a prefix allocation application to the upper-layer network device. The upper-layer network device assigns an appropriate address prefix to the lower-layer device. The lower-layer device automatically subdivides the obtained prefix (generally less than 64 bits in length) into subnet segments with 64-bit prefix length, and then advertises the subdivided address prefixes to the user link directly connected to the IPv6 host through the route to realize automatic address configuration of the host.

5.16.4 Enabling IPv6

Choose **One-Device > Config > Network > IPv6 Address**.

Click **Enable**, and then click **OK** in the dialog box that appears to enable IPv6.

After IPv6 is enabled, you can configure the IPv6 addresses of WAN and LAN ports, view the DHCPv6 client, and configure a static DHCPv6 address for the client.

5.16.5 Configuring the IPv6 Address for the WAN Port

Choose **One-Device** > **Config** > **Network** > **IPv6 Address** > **WAN Settings**.

Configure the IPv6 address for the WAN port, and click **Save**.

Table 5-3 WAN Port IPv6 Address Configuration Parameters

Parameter	Description
Internet	Specify the method for obtaining an IPv6 address for the WAN port. ● DHCP/PPPoE: The current device will act as a DHCPv6 client and apply for the IPv6 address/prefix from the upstream network device. ● Static IP: If this Internet connection type is selected, you need to manually configure a static IPv6 address, gateway address, and DNS server. ● Null: The IPv6 function is disabled on the current WAN port.
IPv6 Address	If Internet is set to DHCP/PPPoE, the automatically obtained IPv6 address is displayed. If Internet is set to Static IP, you need to manually configure this parameter.
IPv6 Prefix	If Internet is set to DHCP/PPPoE and the current device obtains the IPv6 address prefix from the upstream device. The obtained IPv6 address prefix is displayed.
Gateway	If Internet is set to DHCP/PPPoE, the automatically obtained gateway address is displayed. If Internet is set to Static IP, you need to manually configure this parameter.
DNS Server	If Internet is set to DHCP/PPPoE, the automatically obtained DNS server address is displayed. If Internet is set to Static IP, you need to manually configure this parameter.

Parameter	Description
N/AT66	If the current device cannot access the Internet in DHCP mode or cannot obtain the IPv6 address prefix, you must enable N/AT66 to assign the IPv6 address to an intranet client.

5.16.6 Configuring the IPv6 Address for the LAN Port

Choose **One-Device > Config > Network > IPv6 Address > LAN Settings**.

When the device accesses the network in DHCP mode, the upstream device can assign an IPv6 address to the LAN port, and assign IPv6 addresses to the clients in the LAN based on the IPv6 address prefix. If the upstream device cannot assign an IPv6 address prefix to the current device, you need to manually configure an IPv6 address prefix for the LAN port, and assign IPv6 addresses to the clients in the LAN by enabling the N/AT66 function (see [5.16.5 Configuring the IPv6 Address for the WAN Port](#)).

Enable 

WAN Settings **LAN Settings** DHCPv6 Clients Static DHCPv6

LAN Settings 

☐	VLAN ID	IPv6 Assignment	Subnet Prefix Name	Subnet ID	Subnet Prefix Length	IPv6 Address/Prefix Length	Action
☐	Default	Auto		0	64		Edit Delete

Up to 8 entries can be added.

Click **Edit** corresponding to the default VLAN, and fill in a local address of no more than 64 bits in the **IPv6 Address/Prefix Length** column. This address will also be used as the IPv6 address prefix.

IPv6 Assignment specifies the method for assigning IPv6 addresses for clients. The following options are available:

- **Auto**: Both DHCPv6 and SLAAC are used to assign IPv6 addresses to clients.
- **DHCPv6**: DHCPv6 is used to assign IPv6 addresses to clients.
- **SLAAC**: SLAAC is used to assign IPv6 addresses to clients.
- **Null**: No IPv6 addresses are assigned to clients.

The setting of **IPv6 Assignment** is determined by the protocol supported by intranet clients. If you are not sure about the protocol supported by intranet clients, select **Auto**.

6.1 Configuring Client IP Binding

Caution

This function is supported only in router mode.

Choose **Network-Wide > Clients**.

IP address binding is a security and access control policy that associates a specific IP address with a specific device or user to achieve identity authentication, access control, monitoring, and accounting.

- Single client IP address binding
Select the client to be bound with an IP address in the list, click **Not bound**, and click **OK** in the pop-up box to bind the client to a static IP address.

- Batch IP binding
Click **Select**.

Select the clients to be bound, click **Bind IP**, and click **OK** in the pop-up box to bind the selected clients to a static IP address.

- Unbind an IP address

Select the client to be unbound from the list, click **Bound**, and click **OK** in the pop-up box.

All (2) Wired (1) Wireless (1)

Select Block Bind IP Search by IP/MAC/Username

The client going offline will not disappear immediately. Instead, the client will stay in the list for 3 more minutes.

7.3 Setting the Session Timeout Duration

Go to the configuration page:

- In self-organizing network mode: Choose **One-Device > Config > System > Login**.
- In standalone mode: Choose **System > Login > Session Timeout**.

If no operation is performed on the Web page within a period of time, the session is automatically disconnected. When you need to perform operations again, enter the password to log in again. The default timeout duration is 3600 seconds, that is, 1 hour.

*** Session Timeout**  seconds

Save

7.4 Setting and Displaying System Time

Go to the configuration page:

- In self-organizing network mode: Choose **Network-Wide** > **System** > **System Time**.
- In standalone mode: Choose **System** > **System Time**.

You can view the current system time. If the time is incorrect, check and select the local time zone. If the time zone is correct but time is still incorrect, click **Edit** to manually set the time. In addition, the device supports Network Time Protocol (NTP) servers. By default, multiple servers serve as the backup of each other. You can add or delete the local server.

Caution

In self-organizing network mode, the system time of all devices in the network will be changed synchronously.

 Configure and view system time (the device has no RTC module, and time settings are not saved upon restart).

Current Time  2023-12-13 10:22:54 

* Time Zone 

* NTP Server  

7.5 Configuring SNMP

7.5.1 Overview

The Simple Network Management Protocol (SNMP) is a protocol for managing network devices. Based on the client/server model, it can achieve remote monitoring and control of network devices.

SNMP uses a manager and agent architecture. The manager communicates with agents through the SNMP protocol to retrieve information such as device status, configuration details, and performance data. It can also be used to configure and manage devices.

SNMP can be used to manage various network devices, including routers, switches, servers, firewalls, etc. You can achieve user management through the SNMP configuration interface and monitor and control devices through the third-party software.

7.5.2 Global Configuration

1. Overview

The purpose of global configuration is to enable the SNMP service and make the SNMP protocol version (v1/v2c/v3) take effect, so as to achieve basic configuration of local port, device location, and contact information.

SNMP v1: As the earliest version of SNMP, SNMP v1 has poor security, and only supports simple community string authentication. SNMP v1 has certain flaws, such as plaintext transmission of community strings and vulnerability to attacks. Therefore, SNMP v1 is not recommended for modern networks.

SNMP v2c: As an improved version of SNMP v1, SNMP v2c supports richer functions and more complex data types, with enhanced security. SNMP v2c performs better than SNMP v1 in terms of security and functionality, and is more flexible. It can be configured according to different needs.

SNMP v3: As the newest version, SNMP v3 supports security mechanisms such as message authentication and encryption compared to SNMP v1 and SNMP v2c. SNMP v3 has achieved significant improvements in security and access control.

2. Configuration Steps

Choose **Network-Wide > Workspace > Network-Wide > SNMP > Global Config**.

(1) Enable the SNMP service.

When it is enabled for the first time, SNMP v3 is enabled by default. Click **OK**.

(2) Set SNMP service global configuration parameters.

Table 7-1 Global Configuration Parameters

Parameter	Description
SNMP Service	Indicates whether SNMP service is enabled.
SNMP Version	Indicates the SNMP protocol version, including v1, v2c, and v3 versions.
Local Port	The port range is 1 to 65535.
Device Location	1-64 characters. Chinese characters, full-width characters, question marks, and spaces are not allowed.
Contact Info	1-64 characters. Chinese characters, full-width characters, question marks, and spaces are not allowed.

(3) Click **Save**.

After the SNMP service is enabled, click **Save** to make basic configurations such as the SNMP protocol version number take effect.

7.5.3 View/Group/Community/User Access Control

1. Configuring Views

● Overview

Management Information Base (MIB) can be regarded as a database storing the status information and performance data of network devices. It contains a large number of object identifiers (OIDs) to identify the status information and performance data of these network devices.

Views in SNMP can limit the range of MIB nodes that the management system can access, thereby improving the security and reliability of network management. Views are an indispensable part of SNMP and need to be configured or customized according to specific management requirements.

A view can have multiple subtrees. The management system can only access MIB nodes in these subtrees, and cannot access other unauthorized MIB nodes. This can prevent unauthorized system administrators from

accessing sensitive MIB nodes, thereby protecting the security of network devices. Moreover, views can also improve the efficiency of network management and speed up the response from the management system.

● Configuration Steps

Choose **Network-Wide > Workspace > Network-Wide > SNMP > View/Group/Community/Client Access Control > View List**.

(1) Click **Add** under the View List to add a view.

- Community names cannot be the same among v1/v2c users.
 - Click **Add View** to add a view.
-

(3) Click **OK**.

3. Configuring v3 Groups

- Overview

SNMP v3 introduces the concept of grouping to achieve better security and access control. A group is a group of SNMP users with the same security policies and access control settings. With SNMP v3, multiple groups can be configured, each with its own security policies and access control settings. Each group can have one or more users.

- Prerequisites

When the SNMP version is set to v3, the v3 group configuration is required.

Table 7-5 v3 User Configuration Parameters

Parameter	Description
Username	Username At least 8 characters. It must contain at least three character categories, including uppercase and lowercase letters, digits, and special characters. Admin, public or private community names are not allowed. Question marks, spaces, and Chinese characters are not allowed.
Group Name	Indicates the group to which the user belongs.
Security Level	Indicates the security level (authentication and encryption, authentication but no encryption, and no authentication and encryption) of the user.

Parameter	Description
Auth Protocol, Auth Password	Authentication protocols supported: MD5/SHA/SHA224/SHA256/SHA384/SHA512. Authentication password: 8-31 characters. Chinese characters, full-width characters, question marks, and spaces are not allowed. It must contain at least three character categories, including uppercase and lowercase letters, digits, and special characters. Note: This parameter is mandatory when the security level is authentication and encryption, or authentication but no encryption.
Encryption Protocol, Encrypted Password	Encryption protocols supported: DES/AES/AES192/AES256. Encryption password: 8-31 characters. Chinese characters, full-width characters, question marks, and spaces are not allowed. It must contain at least three character categories, including uppercase and lowercase letters, digits, and special characters. Note: This parameter is mandatory when the security level is authentication and encryption.

**Caution**

- The security level of v3 users must be greater than or equal to that of the group.
- There are three security levels, among which authentication and encryption requires the configuration of authentication protocol, authentication password, encryption protocol, and encryption password. Authentication but no encryption only requires the configuration of authentication protocol and encryption protocol, while no authentication and encryption does not require any configuration.

5. Viewing v3 Device Identifier

Choose **Network-Wide > Workspace > Network-Wide > SNMP > View/Group/Community/Client Access Control > SNMP v3 Device Identifier List**.

View the v3 device identifier in the **SNMP v3 Device Identifier List** pane.

7.5.5 Configuring Trap Service

Trap is a notification mechanism of the Simple Network Management Protocol (SNMP) protocol. It is used to report the status and events of network devices to administrators, including device status, faults, performance, configuration, and security management. Trap provides real-time network monitoring and fault diagnosis services, helping administrators discover and solve network problems in a timely manner.

1. Enabling Trap Service

Enable the trap service and select the effective trap version, including v1, v2c, and v3 versions.

Choose **Network-Wide > Workspace > Network-Wide > SNMP > Trap Settings**.

(1) Enable the trap service.

When the trap service is enabled for the first time, the system will pop up a prompt message. Click **OK**.

(2) Set the trap version.

The trap versions include v1, v2c, and v3.

(3) Click **Save**.

After the trap service is enabled, click **Save** for the configuration to take effect.

Global Config View/Group/Community/Client Access Control Trap Settings

Trap Service ☒

* Trap Version ☒ v1 ☐ v2c ☐ v3

2. Configuring Trap v1/v2c Users

● Overview

Trap is a notification mechanism that is used to send alerts to administrators when important events or failures occur on devices or services. Trap v1/v2c are two versions in the SNMP protocol for network management and monitoring.

Trap v1 is the first version that supports basic alert notification functionality. Trap v2c is the second version, which supports more alert notification options and advanced security features.

By using trap v1/v2c, administrators can promptly understand problems on the network and take corresponding measures.

● Prerequisites

Once trap v1 and v2c versions are selected, it is necessary to add trap v1/v2c users.

● Configuration Steps

Choose **Network-Wide > Workspace > Network-Wide > SNMP > Trap Settings**.

(1) Click **Add** in the **Trap v1/v2c Client List** pane to add a trap v1/v2c user.

- Community names of trap v1/ v1/v2c users cannot be the same.

(3) Click **OK**.

3. Configuring Trap v3 Users

- Overview

Trap v3 is a network management mechanism based on the SNMP protocol. It is used to send alert notifications to administrators. Unlike previous versions, trap v3 provides more secure and flexible configuration options, including authentication and encryption features.

Trap v3 offers custom conditions and methods for sending alerts, as well as the recipients and notification methods for receiving alerts. This enables administrators to have a more accurate understanding of the status of network devices and to take timely measures to ensure the security and reliability of the network.

- Prerequisites

When the v3 version is selected for the trap service, it is necessary to add a trap v3 user.

- Configuration Steps

Choose **Network-Wide > Workspace > Network-Wide > SNMP > Trap Settings**.

(1) Click **Add** in the **Trap v3 Client List** pane to add a trap v3 user.

7.6 Configuring Reboot

Caution

- Do not cut off power during system reboot to avoid device damage.
- Do not refresh the page or close the browser during the reboot. After the device is successfully rebooted and the Web service becomes available, the device automatically jumps to the login page.
- Rebooting the device affects the network. Therefore, exercise caution when performing this operation.

7.6.1 Rebooting the Master Device

In self-organizing network mode:

- Choose **Network-Wide > System > Reboot**. Click the **Reboot** tab and select **master device**.
- Choose **Network-Wide > Workspace > Network-Wide > Reboot**. Click the **Reboot** tab and select **master**

device.

Click the **Reboot** button. The master device will restart.

The screenshot shows a web interface with two tabs: 'Reboot' (active) and 'Scheduled Reboot'. Below the tabs is a light blue box with an information icon and the text 'Do not power off the device during reboot.' Below this is a 'Select' label followed by three radio button options: 'master device' (selected and highlighted with a red box), 'All Devices', and 'Specified Devices'. At the bottom is a blue 'Reboot' button.

7.6.2 Rebooting Local Device

- In self-organizing network mode, choose **One-Device > Config > System > Reboot**.

Click the **Reboot** button. The device will restart.

The screenshot shows a web interface with the 'Reboot' tab selected. Below the tab is a light blue box with an information icon and the text 'Do not power off the device during reboot.' Below this is a blue 'Reboot' button.

- In standalone mode: choose **System > Reboot > Reboot**.

Click the **Reboot** button. The device will restart.

The screenshot shows a web interface with the 'Reboot' tab selected. Below the tab is a light blue box with an information icon and the text 'Do not power off the device during reboot.' Below this is a blue 'Reboot' button.

7.6.3 Rebooting All Devices on the Network

In self-organizing network mode, you can batch reboot all devices on the network.

Go to the configuration page:

- Choose **Network-Wide > System > Reboot**. Click the **Reboot** tab and select **All Devices**.
- Choose **Network-Wide > Workspace > Network-Wide > Reboot**. Click the **Reboot** tab and select **All Devices**.

Click the **Reboot** button to batch reboot all devices on the network.

Caution

It takes time to reboot all devices in the current network. The action may affect the whole network. Please be cautious.

7.6.4 Rebooting the Specified Devices

In self-organizing network mode, you can reboot specified devices in the network in batches. Go to the configuration page:

- Choose **Network-Wide > System > Reboot**. Click the **Reboot** tab and select **Specified Devices**.
- Choose **Network-Wide > Workspace > Network-Wide > Reboot**. Click the **Reboot** tab and select **Specified Devices**.

Select required devices from the **Available Devices** list, and click **Add** to add devices to the **Selected Devices** on the right.

7.7 Configuring Scheduled Reboot

Confirm that the system time is accurate to avoid network interruption caused by device reboot at wrong time. For details about how to configure the system time, see [7.4 Setting and Displaying System Time](#).

Go to the configuration page:

- Choose **Network-Wide > System > Reboot > Scheduled Reboot**.
- Choose **Network-Wide > Workspace > Network-Wide > Reboot > Scheduled Reboot**.
- AP as master device: Choose **One-Device > Config > System > Reboot > Scheduled Reboot**.

Caution

If you configure scheduled reboot on the management webpage, all devices will restart when the system time matches with the scheduled reboot time. Please be cautious.

Click **Scheduled Reboot**, and select the date and time of scheduled reboot every week. Click **Save**. When the system time matches with the scheduled reboot time, the device will restart. You are recommended to set scheduled reboot time to off-peak hours.

Reboot Scheduled Reboot

1. After this feature is enabled, the device will reboot at the scheduled time.
 2. You are advised to set the scheduled reboot time in the early morning or other service idle time.
 Note: When the upstream device is rebooted at the scheduled time, all downstream devices connected to it will also be rebooted.

7.8 Configuring Backup and Import

Go to the configuration page:

- Choose **Network-Wide > System > Backup & Import**.
- Choose **One-Device > Config > System > Backup > Backup & Import**.

Configuration backup: Click **Backup** to download a configuration file locally.

Configuration import: Click **Browse**, select a backup file on the local PC, and click **Import** to import the configuration file. The device will restart.

- i** If the target version is much later than the current version, some configuration may be missing.
1. Before importing the configuration file, you are advised to [Reset](#) the device.
 2. After the configuration file is imported, the device will reboot automatically.

7.13 Configuring Cloud Service

7.13.1 Overview

The Cloud Service feature provides powerful remote network management and operation capabilities, making it convenient and efficient to manage geographically dispersed networks with diverse device types. This feature supports wireless devices, switches, and gateways, enabling unified network management and visualized monitoring and operation. Additionally, it also offers various components such as real-name authentication, dedicated Wi-Fi, and passenger flow analysis, allowing for flexible expansion of network services.

By configuring Cloud Service, you can conveniently manage networks through Ruijie Cloud or the Ruijie Reyee app.

7.13.2 Configuration Steps

Choose **One-Device > Config > System > Cloud Service**.

If the device is not currently associated with a cloud account, simply follow the on-screen instructions to add it to the network. Open up the Ruijie Reyee app, click the scan icon at the upper left corner on the **Project** page, and enter the device's management password.

Once the device is associated with a cloud account, it will automatically be bound to a cloud server based on its geographic location.

Caution

Exercise caution when modifying cloud service configurations as improper modifications may lead to connectivity issues between the device and the cloud service.

Cloud Server

☒ China CloudConnected [Cancel](#)

This device is connected to Ruijie Cloud. The IP is 120.27.22.80, Exercise caution when modifying the cloud service configuration to ensure uninterrupted device connectivity.

Cloud Server [Reset](#)

* Domain Name [Configure IP](#)

IP Address

[Save](#)

To change the Cloud Service configurations, select the cloud server from the **Cloud Server** drop-down list, enter the domain name and IP address, and click **Save**.

Note

If the server selected is not **Other Cloud**, the system automatically fills in the domain name and IP address of the cloud server. When **Other Cloud** is selected, you need to manually configure the domain name and IP address and upload the cloud server certificate.

Table 7-12 Cloud Server Description

Parameter	Description
Cloud Server	Geographic location of the cloud server, including China Cloud, Asia Cloud, Europe Cloud, America Cloud, and Other.
Domain Name	Domain name of the cloud server.
IP Address	IP address of the cloud server.

7.13.3 Unbinding Cloud Service

Choose **One-Device > Config > System > Cloud Service**

You can click **Unbind** to unbind the account if you no longer wish to manage this project remotely.

Project Name:radio

Account:

Unbind the account if you no longer wish to manage this project remotely.

It is used to unbind all devices throughout the network. To unbind a single device, remove the device from the network and restore its default settings.

Unbind

8 Network Diagnosis Tools

Caution

If the issue persists despite following the troubleshooting methods provided in this section, you may require remote support from a technician who will enable developer mode to resolve the issue. We will ensure your data is protected during this process.

8.1 Network Check

When a network problem occurs on the device, perform a network check and configure the device based on the detection result.

Go to the configuration page: Choose **One-Device** > **Config** > **Diagnostics** > **Diagnose**.

(1) Click **Start** to perform the network check and show the result.

Recheck	
100%	
WAN/LAN Cable Connection	✓
Negotiation Speed	✓
WAN Port Configuration	✓
DHCP IP Address Allocation	✓
Loop Detection	✓
IP Conflicts	✓
Routing Configuration	✓

DNS Configuration	✓
IP Session Count	✓
Cloud Service Configuration	✓

(2) After performing the network check, you will find the check result and suggested action.

IP Session Count	✓
DHCP Capacity	✓
Ruijie Cloud Server	!
Check Connection to Cloud Server Result : The device is not connected with the cloud server. Cloud service may fail to start. Suggestion : Please verify that the device SN is added to the cloud and check the network.	

8.2 Network Tools

Choose **One-Device > Config > Diagnostics > Network Tools**.

- The Ping tool tests the connectivity between the access point and the IP address or URL. The message "Ping failed" indicates that the access point cannot reach the IP address or URL.
- The Traceroute tool displays the network path to a specific IP address or URL.
- The DNS Lookup tool displays the DNS server address used to resolve a URL.

Enter an IP address or a URL, and click **Start**. If you need to perform the ping or Traceroute operation, configure other parameters as required.

8.4 Fault Collection

Choose **One-Device > Config > Diagnostics > Fault Collection**.

When an unknown fault occurs on the device, you can collect fault information on this page. Click **Start** to collect fault information and compress it into a file for engineers to identify fault.

 Compress the configuration file for engineers to identify fault.

Start

8.5 Packet Capturing

Choose **One-Device > Config > Diagnostics > Packet Collection**.

If the device fails and troubleshooting is required, the packet capture result can be analyzed to locate and rectify the fault.

Select an interface and a protocol and specify the host IP address to capture the content in data packets. Select the file size limit and packet count limit to determine the conditions for automatically stopping packet capture. (If the file size or number of packets reaches the specified threshold, packet capture stops and a diagnostic package download link is generated.)

Caution

The packet capture operation may occupy excessive system resources, causing network freezing. Therefore, exercise caution when performing this operation.

If you have not installed the packet capture component, you need to download it from the cloud by clicking **Download Component Package**.

 Tips: Feature to be initialized. Download the component package from Ruijie Cloud! [Download Component Package](#)

Table 8-1 Packet Collection Configuration Parameters

Parameter	Description
Interface	Physical or logical interface on the network
Protocol	Protocol used by the packet
IP	IP address of the device
MAC	MAC address of the device
File Size Limit	The maximum amount of data allowed to be stored within a certain time period. If this limit is reached during packet capture, new packet capture will be stopped, or excess packets will be discarded. The maximum limit is 10 MB.
Packet Count Limit	The number of packets stored and analyzed during packet capture. The maximum limit is 1500. Caution You can configure either the packet count limit or the file size limit, as they are mutually exclusive parameters.
Wireless Sniffing	You can select a wireless interface for packet capture only after enabling this function. After this function is enabled, the interface will be marked as Down, and the Wi-Fi network will be unavailable. To prevent users from forgetting to disable this function and causing the Wi-Fi network to be unusable, the system will automatically disable this function 10 minutes later after it is enabled.

Packet capture can be stopped at any time. After that, a download link is generated. Click this link to save the packet capture result in the PCAP format locally. Use analysis software such as Wireshark to view and analyze the result.

9 FAQs

9.1 Login Failure

➤ What can I do when I failed to log in to the web interface?

Perform the following steps:

- (1) Check that the Ethernet cable is properly connected to the LAN port of the device.
- (1) Before accessing the setup page, you are advised to choose **Auto** for the device enabled with DHCP service to assign an IP address to the PC. If you want to configure a static IP address for the PC, please make sure the IP address of the PC and the LAN port are in the same IP range. The default IP address of the LAN port is 10.44.77.254, and the subnet mask is 255.255.255.0. The IP address of the PC should be set to 10.44.77.X (X is an integer between 2 and 254), and the subnet mask is 255.255.255.0.
- (2) Run the **Ping** command to check the connectivity between the PC and the device. If the ping fails, please check the network settings.
- (3) If the login failure persists, restore the device to factory settings.

9.2 Factory Setting Restoration

➤ How can I restore the device to factory settings?

Power on the device and press the **Reset** button for more than 5 seconds. The device is restored to factory settings after it is restarted. Then, you can log in to the web interface using the default IP address (10.44.77.254).

9.3 Password Loss

➤ What can I do when I forget the password?

- Webpage management password loss: Please enter the Wi-Fi password. If it is still incorrect, please restore the device to factory settings.
- Wi-Fi password loss: When the access point expands the Wi-Fi coverage, its Wi-Fi password is consistent with that of the master router. Please check the configuration of the master router and enter its Wi-Fi password. If the password is still incorrect, please restore the device to factory settings and reconfigure the Wi-Fi password.
